[EPA # 530-Z-96-002; FRL-5438-3]

Land Disposal Restrictions Phase III— Decharacterized Wastewaters, Carbamate Wastes, and Spent Potliners

AGENCY: Environmental Protection Agency (EPA). ACTION: Final rule.

SUMMARY: EPA is promulgating treatment standards for hazardous wastes from the production of carbamate pesticides and from primary aluminum production under its Land Disposal Restrictions (LDR) program. The purpose of the LDR program, authorized by the Resource Conservation and Recovery Act (RCRA), is to minimize short- and long-term threats to human health and the environment due to land disposal of hazardous wastes.

The Agency is also amending the treatment standards for hazardous wastes that exhibit the characteristic of reactivity. The rule also begins the process of amending existing treatment standards for wastewaters which are hazardous because they display the characteristic of ignitability, corrosivity, reactivity, or toxicity. These wastes are sometimes treated in lagoons whose ultimate discharge is regulated under the Clean Water Act, and sometimes injected into deepwells which are regulated under the Safe Drinking Water Act. Prior to today's rule, the treatment standard for these wastes required only removal of the characteristic property. Today's revised treatment standards require treatment, not only to remove the characteristic, but also to treat any underlying hazardous constituents which may be present in the wastes. Therefore, these revised treatment standards will minimize threats from exposure to hazardous constituents which may potentially migrate from these lagoons or wells.

Finally, EPA is codifying as a rule its existing Enforcement Policy that combustion of inorganic wastes is an impermissible form of treatment because hazardous constituents are being diluted rather than effectively treated.

EFFECTIVE DATE: This final rule is effective on April 8, 1996, except:

Sections 148.18(a), 268.39(a), (b), and (f), which are effective on July 1, 1996; and

Sections 148.18(b) and 268.39(c), which are effective on January 8, 1997; and

Sections 148.1 (a), (b), and (d), 148.3, 148.4, 148.18 (c) and (d), 148.20(a), 268.1(e), 268.2 (k) and (l), 268.3 (a) and (b), 268.9 (d), (e), (f), and (g), 268.39 (d) and (e), 268.44(a), and 403.5 (c) and (d), which are effective on April 8, 1998. ADDRESSES: Supporting materials are available for viewing in the RCRA information Center (RIC), located at Crystal Gateway One, 1235 Jefferson Davis Highway, First Floor, Arlington, VA. The Docket Identification Number is F-96-PH3F-FFFFF. The RCRA Docket is open from 9 a.m. to 4 p.m. Monday through Friday, except for Federal holidays. The public must make an appointment to review docket materials by calling (703) 603-9230. The public may copy a maximum of 100 pages from any regulatory document at no cost. Additional copies cost \$0.15

FOR FURTHER INFORMATION CONTACT: For general information on the LDR program, contact the RCRA Hotline at 800–424–9346 (toll-free) or 703–412–9810 locally. For general information on today's rule, contact Peggy Vyas in the Office of Solid Waste, phone 703–308–8594.

I. Background

A. Summary of the Statutory Requirements of the 1984 Hazardous and Solid Waste Amendments, and Requirements of the 1993 Consent Decree With the Environmental Defense

The Hazardous and Solid Waste Amendments (HSWA) to the Resource Conservation and Recovery Act (RCRA), enacted on November 8, 1984, largely prohibit the land disposal of untreated hazardous wastes that do not meet treatment standards established by EPA under section 3004(m). Once a hazardous waste is prohibited, the statute provides only two options for legal land disposal: meet the treatment standard for the waste prior to land

disposal, or dispose of the waste in a land disposal unit that has been found to satisfy the statutory no migration test. A no migration unit is one from which there will be no migration of hazardous constituents for as long as the waste remains hazardous. RCRA sections 3004 (d), (e), (f), (g)(5).

The amendments also require the Agency to set levels or methods of treatment, if any, which substantially diminish the toxicity of the waste or substantially reduce the likelihood of migration of hazardous constituents from the waste so that short term and long term threats to human health and the environment are minimized. RCRA section 3004(m)(1). To date, the Agency has implemented this provision by establishing treatment standards for chemical constituents in hazardous wastes based on the performance of the best demonstrated available technology (BDAT) to treat the waste. EPA may establish treatment standards as specified technologies, as constituent concentration levels in treatment residuals, or both. When treatment standards are set as levels, the regulated community may use any technology not otherwise prohibited (such as impermissible dilution) to treat the waste.

It should be noted that the Agency has proposed risk-based exit levels—levels at which wastes are no longer considered hazardous for purposes of RCRA subtitle C-for the majority of hazardous constituents found in listed hazardous wastes in the Hazardous Waste Identification Rule (HWIR) (60 FR 66344, December 21, 1995). Wastes meeting these levels either before or after treatment consequently could be disposed in units not subject to RCRA hazardous waste management requirements (e.g., landfills without subtitle C permits). A consent decree approved by the U.S. District Court for the District of Columbia requires EPA to finalize the HWIR exit levels by December 15, 1996. In the same notice, the Agency proposed to allow the exit levels for some constituents to serve as alternative, risk-based LDR treatment standards satisfying the "minimize threat" standard of section 3004(m). Where these risk-based levels are higher (less restrictive) than current BDAT treatment standards, they will effectively supersede the BDAT requirements. See Hazardous Waste Treatment Council v. EPA, 886 F.2d 355, 362-63 (D.C. Cir. 1989).

EPA was required to promulgate land disposal prohibitions and treatment standards by May 8, 1990 for all wastes that were either listed or identified as hazardous at the time of the 1984 amendments (RCRA sections 3004 (d), (e), and (g)(5)), a task EPA completed within the statutory timeframe. EPA was also required to promulgate prohibitions and treatment standards for wastes identified or listed as hazardous after the date of the 1984 amendments within six months after the listing or identification takes effect (RCRA section 3004(g)(4)).

The Agency did not meet this latter statutory deadline for all of the wastes identified or listed after the 1984 amendments. As a result, a suit was filed by the Environmental Defense Fund (EDF). EPA and EDF signed a consent decree that establishes a schedule for adopting prohibitions and treatment standards for newly identified and listed wastes. (EDF v. Reilly, Cir. No. 89-0598, D.D.C.). EPA also entered into a settlement agreement with the environmental petitioners in Chemical Waste Management v. EPA, 976 F.2d 2 (D.C. Cir. 1992), cert. denied 113 S. Ct. 1961 (1993) regarding the procedural effect of the mandate entered in that case. This settlement calls for EPA to take action to implement the portions of the opinion dealing with centralized management of wastewaters that initially exhibit a hazardous waste characteristic within specified timeframes.

Today's rule fulfills several provisions of the settlement agreement and proposed consent decree. First, the rule amends the treatment standards for initially characteristic wastewaters managed in centralized wastewater management systems containing land disposal units. Three specific fact patterns are covered by the rule: (1) Where the wastewaters are ultimately discharged and are subject to limitations or standards established under the Clean Water Act (CWA) and the treatment system preceding discharge includes a surface impoundment; (2) where a facility with initially characteristic wastes treats those wastes with CWA-equivalent treatment but ultimately uses a form of land disposal (such as spray irrigation) that is not regulated under the CWA as the final means of disposing of the treated wastewaters; and (3) the initially characteristic wastes are injected into Class 1 non-hazardous deep wells subject to regulation under the Safe Drinking Water Act (SDWA). In all cases, the wastewaters no longer exhibit a characteristic at the point of land disposal. The amended treatment standards require treatment that destroys, immobilizes, or removes the hazardous constituents present in the initially characteristic wastewaters (referred to as "underlying hazardous

constituents" because these constituents are not typically the reason the waste is classified as hazardous). Treatment of the underlying hazardous constituents is nevertheless required in order to minimize the long-term threats land disposal of these wastes can cause. 976 F.2d at 16–17.

EPA is fulfilling provisions of the consent decree by promulgating prohibitions and treatment standards for two "newly listed wastes" wastes from production of carbamate pesticides, and spent aluminum potliners from primary

aluminum production.

That being said, the risks addressed by the portion of the rule dealing with centralized wastewater management, particularly UIC wells, are very small relative to the risks presented by other environmental conditions or situations. In a time of limited resources, common sense dictates that we deal with higher risk activities first, a principle on which EPA, members of the regulated community, and the public can all agree. For this reason, the Administration is supporting HR 2036, legislation which passed the House of Representatives, that would remove the mandate to automatically apply LDR treatment standards to decharacterized wastes managed in centralized wastewater management situations regulated by the CWA or the SDWA. If this legislation passes in its current form, it would affect the regulations discussed in sections III., IV., and VI.B. of the preamble. It would not affect the other sections of the preamble and rule. The sections of preamble and rule that are affected by the legislation have been granted 2-year national capacity variance (see §§ 148.18 (c) and (d) and 268.39 (c) and (d)). The sections of preamble and rule not affected by the legislation have more immediate effective dates. If the legislation does pass into law, the Agency could issue an immediately effective final rule remanding the affected portions.

Nevertheless, the Agency is presently required to set treatment standards for these relatively low risk wastes and disposal practices, although there are other actions and projects with which the Agency could provide greater protection of human health and the environment. At the same time, however, EPA has sought to exercise the full extent of its authority under current law to implement these mandates with significantly lower cost while ensuring protectiveness, such as giving credit for up-stream reductions in hazardous constituents, and crafting limited exemptions for wastewaters containing de minimis amounts of hazardous constituents.

B. Treatment Standards for Hazardous Wastes That Exhibit a Characteristic— The D.C. Circuit's Opinion in Chemical Waste Management v. EPA

In Chemical Waste Management v. EPA, 976 F.2d 2 (D.C. Cir. 1992) cert. denied 113 S. Ct. 1961 (1993), the court made a number of far-reaching rulings pertaining to treatment standards for hazardous wastes that are hazardous because they exhibit a characteristic. First, the court held that land disposal restriction requirements can continue to apply to characteristic hazardous wastes even after they no longer exhibit a characteristic. 976 F.2d at 12-14. Second, to satisfy the requirement in RCRA section 3004(m) that treatment address both short-term and long-term threats posed by a waste's land disposal, it is not enough that characteristic hazardous wastes be treated to remove the short-term property (viz. ignitability, corrosivity, or reactivity) that makes them hazardous. Long-term threats, in the form of toxic underlying hazardous constituents, also must be addressed. 976 F.2d at 16-17. Third (as EPA reads the opinion), the court held that dilution was ordinarily not a permissible means of treating hazardous constituents. Such constituents generally must be destroyed, immobilized, or removed from the waste to satisfy the requirements of section 3004(m), specifically, the requirement that long-term threats be minimized. 976 F.2d at 23, 25 and n. 8; 60 FR at 11706-11708 (March 2, 1995). Fourth, centralized wastewater management systems whose discharge is ultimately regulated under the Clean Water Act, and which dilute characteristic hazardous wastes before treatment in surface impoundments, may continue to do so provided the wastewater treatment system destroys, immobilizes, or removes the same volume of hazardous constituents as would be removed, immobilized, or destroyed if the wastes were treated separately. 976 F.2d at 22-24. In other words, notwithstanding that these wastes are disposed in impoundments without being fully treated, the practice is permissible provided equivalent treatment occurs before the waste is ultimately discharged. Fifth, this option of demonstrating equivalent treatment across a treatment system is not available for Class I nonhazardous deep well injection systems because such units are permanent disposal rather than treatment units. 976 F.2d at 24-6.

These portions of the opinion are addressed in various sections of today's rule.

The Agency is also addressing the issue of equivalent treatment by Clean Water Act treatment systems managing de-characterized wastes in impoundments by promulgating treatment standards and related requirements that would be used to measure this so-called end-of-pipe equivalence. Finally, EPA is implementing the court's mandate with respect to Class I nonhazardous injection wells by requiring treatment of underlying hazardous constituents in ignitable, and corrosive characteristic wastes being injected into such wells, and prohibiting dilution as a means of achieving those standards.

Responses to the comments on EPA's reading of the court's opinion are found in the Response to Comment Background Document which is part of the administrative record for this rule. In general, however, the Agency adheres to the reading set out in the proposed rule's preamble at 60 FR 11706–11708.

EPA is also amending the treatment standards for reactive wastes (other than reactive sulfide and cyanide reactive wastes) so that treatment addresses both the property of reactivity and the threat posed by disposal of underlying hazardous constituents in these wastes (with an exception for ordnance and other explosives which are the subject of an emergency response, as explained in the next paragraph). The Agency is taking this action despite the fact that the court found reactive wastes did not contain sufficient concentrations of hazardous constituents to require any treatment beyond that of removing the characteristic. The Agency believes that it is as likely that reactive wastes contain underlying hazardous constituents at levels that may create a threat as do ignitable and corrosive wastes, and consequently, proposed to regulate reactive wastes in the Phase III proposal. Commenters submitted no data suggesting that reactive wastes do not contain the same types and concentrations of underlying hazardous constituents. Therefore, EPA is promulgating treatment standards for reactive wastes (other than reactive sulfides and cyanides) in this rule that require treatment of all underlying hazardous constituents reasonably expected to be present in the reactive wastes at the point of generation.

EPA is, however, temporarily deferring application of these amended LDR treatment standards for reactive wastes with respect to unexploded ordnance and other explosive devices which are the subject of an emergency response. An emergency response is an action taken to prevent imminent risk of explosion. (See 40 CFR 264.1(g)(8)

setting out circumstances where such responses are exempt from RCRA permitting requirements.) During the development of the proposed Military Munitions Rule: Hazardous Waste Identification and Management; Explosives Emergencies; Redefinition of On-site proposed rule (60 FR 56468, November 8, 1995), the Department of Defense, the military services, and other Federal agencies raised concerns that LDR requirements requiring treatment of underlying hazardous constituents might impede the most effective emergency responses involving these materials. If a responding team had to determine LDR applicability before deactivating an explosive subject to an emergency response, the response could be significantly delayed or complicated. Furthermore, concern about LDR applicability might discourage the team from responding at all. This discussion serves as EPA's initial response to these comments.

EPA agrees that the primary goal in emergency responses to explosives is the safe and prompt elimination of immediate threats to human life and property, and the Agency would be concerned if LDR or other regulatory requirements complicated these responses. The issue is too important and potentially complicated to resolve in today's rule. Therefore, EPA is temporarily deferring final action while it considers this issue further.

In deferring action for this limited class of reactive wastes, EPA notes that emergency responses present issues different from routine management of reactive wastes, where there is no competing consideration of need for immediate action to prevent an imminent threat. In non-emergency response management situations, as discussed earlier, the Agency believes these wastes can be fully treated to minimize both short and long-term threats posed by land disposal of wastes. EPA also is amending the treatment standards for wastes exhibiting the toxicity characteristic to include standards for underlying hazardous constituents.

Toxic wastes can also contain underlying hazardous constituents in the same potentially harmful concentrations as ICR wastes. 60 FR at 11706. Today's final rule consequently conforms standards for toxic characteristic hazardous wastes to assure treatment of underlying hazardous constituents as well, when

such constituents are present at levels exceeding the minimize threat level (as established either by the current technology-based standards or, if risk-based levels are established, exceeding a risk-based level.) Thus, the prohibitions and standards in today's rule will apply to ignitable, corrosive, reactive and toxic characteristic wastes, as just discussed.

II. Miscellaneous Issues for Which EPA Is Not Finalizing an Approach in This Final Rule

A. Treatment Standards for Organobromine Wastes

Organobromine wastes are not yet listed as hazardous. EPA anticipates making a final listing determination in a future rulemaking.

Although EPA proposed treatment standards for organobromine wastes, it clearly would be putting the cart before the horse to promulgate treatment standards in advance of a determination of whether the wastes are hazardous. The Agency intends to establish treatment standards for organobromine wastes should these wastes are listed in the future.

B. Potential Prohibition of Nonamenable Wastes From Land-Based Biological Treatment Systems

The proposed rule contained an extensive discussion of whether certain wastes should be prohibited from placement in biological treatment surface impoundments because they are not amenable to biological treatment. To allow more time to gather comments, the Agency has decided to address this issue in the LDR Phase IV rule, which was proposed on August 22, 1995 (60 FR 43654) and is scheduled to be finalized in June of 1996.

C. Certain Sections of Completing Universal Treatment Standards

The LDR Phase III proposed rule included a section on the completion of universal treatment standards (60 FR at 11727, March 2, 1995). Possible nonwastewater universal treatment standards (UTS) for eleven constituents were discussed in the proposal, and comments and data were solicited. In general, commenters felt more data should be gathered before EPA proposes nonwastewater standards for these constituents, and EPA agrees. EPA had also solicited comment and data on extending certain universal treatment standards to fill gaps in the § 268.40 table of universal treatment standards where "NA" appeared for either the wastewater or nonwastewater form of a regulated hazardous constituent.

Commenters were opposed to this, stating that it would be arbitrary to add a standard to a waste code where before there was none without supporting data. The Agency again agrees. Therefore, EPA is not taking final action at this time.

D. Prohibition of Hazardous Waste as Fill Material

EPA proposed to prohibit use of hazardous waste as fill material. 60 FR at 11732. Because issues raised in the proposal are related to those in a number of other pending rulemakings, including the Hazardous Waste Identification Rule, and the proposed rule relating to land-based uses of hazardous waste K061 (59 FR 67256 (Dec. 29, 1994)), EPA is not taking final action on the proposal at this time.

E. Point of Generation

The Agency discussed possible changes that could be made to the "point of generation"—or point at which LDR requirements attach to a hazardous waste (see 60 FR 11717, March 2, 1995). The Agency is still considering the options discussed in the proposal and potentially other options not discussed. The Agency will reopen the point of generation issue for further comment, and is intending to finalize an option in a future rulemaking.

F. Prohibition on Using Iron Filings to Stabilize Spent Foundry Sand

The Agency proposed designating the practice of adding iron dust/filings to spent foundry sand as impermissible dilution (60 FR 11731, March 2, 1995). The Agency is gathering data on the stability of the chemical bond formed between the iron and lead in the spent foundry sand. After the Agency analyzes these data, as well as further studies the public comments on this issue, it may take final action on the proposal.

III. End-of-Pipe Equivalence: Treatment Standards for Clean Water Act (CWA) and CWA-Equivalent Wastewater Treatment Systems

A. Types of Facilities to Which Treatment Standards Apply

As explained above, the D.C. Circuit established a standard of so-called end-of-pipe equivalence, allowing CWA treatment systems with surface impoundments to dilute characteristic wastes before land disposal in those impoundments without violating LDR requirements, provided the treatment system destroys, immobilizes, or removes an equivalent amount of hazardous constituent as if the characteristic waste were treated separately to meet RCRA standards. EPA

¹EPA also notes that it is not reopening the issue of open burning/open detonation of reactive wastes. In 1986, EPA determined that such activities are not a form of land disposal. See 51 FR at 40580 (Nov. 7, 1986).

is establishing in this rule the treatment standards that must be satisfied in order to demonstrate that equivalent treatment

is occurring.

These treatment standards apply to the following types of facilities: (1) facilities treating formerly characteristic wastes in surface impoundments whose ultimate discharge is subject to regulation under either section 402 or 307 of the CWA. The rule thus encompasses both direct dischargers (facilities discharging to navigable waters) and indirect dischargers (those discharging to POTWs); and, (2) permitted and unpermitted zero dischargers engaging in treatment that is equivalent to that of the CWA-regulated facilities (see 40 CFR 268.37(a) defining CWA-equivalent treatment), including facilities treating formerly characteristic wastes in tanks prior to release on the land for such purposes as irrigation or land treatment

EPA also wishes to make clear the types of wastewater management situations to which these standards do not apply. First, the standards do not apply to facilities that discharge to navigable waters or POTWs and that manage decharacterized wastes in treatment systems without surface impoundments. Consequently, if a facility generates a characteristic waste, dilutes it so that it no longer exhibits a characteristic, and then treats the waste in tanks before ultimate discharge to a navigable water or a POTW, this rule does not apply. There is no land disposal of a prohibited waste occurring and consequently no RCRA requirement that the characteristic waste be pretreated. Applicable CWA limitations and standards would, of course, continue to apply (as would a one-time recordkeeping requirement under RCRA

Second, the standards do not apply in situations where RCRA hazardous waste (subtitle C) impoundments are used. The statute already sets out the requirements for subtitle C impoundments receiving wastes which may not yet have met a treatment standard. RCRA section 3005(j)(11) These requirements are not altered by the Third Third opinion. 976 F. 2d at 24

Finally, in response to comment, EPA has determined that the end-of-pipe treatment standards should not apply to stormwater impoundments. Stormwater impoundments are used by treatment facilities to catch stormwater during rain events, because their biological treatment systems cannot adequately handle such sudden, large volumes of water. At some treatment facilities, however, because they have a combined

wastewater system, stormwater impoundments also receive process water containing decharacterized wastes.

The Agency agrees with commenters who stated that stormwater impoundments are necessary to maintain the efficacy of biological treatment units. In addition, such impoundments are empty most of the time because they are designed for emergency rain events. In the Third Third opinion, the court focused on wastewater treatment surface impoundments. It seems likely that stormwater impoundments were outside the court's consideration. Furthermore, imposing treatment standards on such impoundments could require treatment of the stormwater/decharacterized waste before it could permissibly go into the impoundment, not a practical alternative during a major storm event. Alternatively, imposing LDR treatment standards might require the facility to replace its combined wastewater system, which would be a major disruption to most of these facilities and hardly seems justified when stormwater impoundments are used only on an emergency basis. These are the very types of disruptions that the integration clause in RCRA 1006(b) is intended to prevent. Consequently, EPA is indicating that today's rule does not apply to stormwater impoundments.

B. End-of-Pipe Treatment Standards

The treatment standards that EPA is promulgating for characteristic wastewaters are found in the table of LDR treatment standards at 40 CFR 268.40 and 268.48. As explained more fully in the following section, these treatment standards generally adopt the limitations or standards that apply to the facility's discharge as the RCRA treatment standards. The reason EPA is taking this approach is that the CWA industry category or case-by-case industrial POTW limitations and standards represent specific determinations of what Best Available Treatment (BAT) technology is capable of achieving for that plant's wastewater, or, in the case of Water Quality Criteriabased limitations, what an appropriate limit is based on BAT treatment plus risk-based considerations. In the event a hazardous constituent present in the wastewater at point of generation of the original characteristic hazardous waste is not already regulated pursuant to a CWA limitation or standard, the RCRA Universal Treatment Standard for that constituent would apply.

These treatment standards may be met at the CWA point of compliance, typically the point the wastewater is

discharged to a navigable water or a POTW. For CWA-equivalent facilities, the treatment standards must be met at the point where the wastewater is sprayed onto the land in irrigation (or similar) activities, or injected into a non-Class I injection well. This accords with the equivalence standard established by the court: "hazardous constituents are [to be] removed from the waste before it enters the environment." 976 F. 2d at 24; see also id. at 23 and n. 8. Most commenters likewise agreed with an end-of-pipe measuring point. Indeed, requiring full treatment before ultimate discharge could destroy the very accommodation with the CWA regime that the court thought critical. See 60 FR at 13677

(Aug. 22, 1995).

However, EPA also agrees with commenters that there is no reason to impede individual facilities from choosing an alternative point of compliance (i.e. other than end-of-pipe) provided the facility can demonstrate that the prohibited waste (the decharacterized portion of the combined effluent) has been treated by means other than dilution to remove an equivalent mass of hazardous constituents. This is specifically consistent with the principle announced in the Administration's report on "Reinventing Environmental Regulation" to "provid[e] maximum flexibility in the means of achieving our environmental goals, but requiring accountability for the results" Consequently, the Agency is allowing a facility to designate any compliance point downstream of treatment that destroys, immobilizes, or removes hazardous constituents as the point for demonstrating that equivalent treatment occurs. This point can, but need not be, the NPDES or pretreatment point of compliance. Examples of alternative points of compliance that would be permissible (assuming the treatment standard is being satisfied) would be prior to initial placement in an impoundment, or after treatment in an impoundment but before final discharge.

The Agency also agrees with commenters that there can be alternative points of compliance for different underlying hazardous constituents. Again, the reason is to allow flexibility of compliance alternatives when a facility can demonstrate that it is destroying, immobilizing, or removing an equivalent mass of hazardous constituents through wastewater treatment as would be achieved by segregating the characteristic wastestream for separate RCRA treatment. Thus, if a facility generated a

characteristic waste containing metal and organic underlying hazardous constituents and the waste was treated sequentially by means not involving impermissible dilution, there could be different compliance points for the metal and organic hazardous constituents.

EPA notes, however, that if alternative points of compliance are utilized, enforcement would normally be pursuant to RCRA, not the Clean Water Act. This is by necessity, since CWA permits (or, for indirect dischargers, control mechanisms) would not normally apply to effluent quality before final discharge. See further discussion on means of implementing today's standards below in this preamble.

C. Why CWA Limitations and Standards Can Also Be RCRA Treatment Standards

As explained above, when a hazardous constituent is already subject to a CWA industry category or Water Quality Criteria-based limitation, or a case-by-case industrial POTW limitation or standard, the Agency believes (and the final rule provides) that the CWA limitations and standards satisfy RCRA section 3004(m) requirements and consequently become the RCRA treatment standard for purposes of demonstrating equivalent treatment. EPA believes that this is an obvious and effective means of integrating CWA and RCRA requirements, in accord with the court's objective. 976 F. 2d at 22; RCRA section 1006(b). This approach was generally supported by commenters as a reasonable means of satisfying the court's mandate and the underlying policy of integration of the two statutes.

Several commenters, however, argued that CWA limitations and standards could not be equivalent to RCRA because such standards can reflect (among other things) "the cost of achieving such effluent reduction", and "the age of equipment and facilities involved". CWA section 304(b)(2)(B) (factors to be considered in determining Best Available Technology). EPA disagrees. While it is true that technology-based standards developed to address toxic pollutants from various industrial categories are developed after consideration of levels that can be achieved through application of the best available technology economically achievable, the CWA limitations and standards nevertheless represent the best evaluation of what technically advanced wastewater treatment is capable of achieving for a particular industry's (or, in some cases, particular plant's) wastewater. Although there is no requirement that a particular

treatment technology must be used to achieve the facility's limits, it is expected that plants utilizing BAT will have treated their effluent so that there are substantial reductions in concentration and mass of hazardous constituents. As the Agency has stated many times, EPA believes that section 3004(m) is satisfied by treatment that substantially destroys, immobilizes, and removes the hazardous constituents that are present in the waste, notwithstanding that minor amounts of hazardous constituents remain after treatment. Put another way, the statute does not require that every conceivable threat posed by land disposal be eliminated by treatment. 55 FR at 6641

and n. 1 (Feb. 26, 1990); 56 FR at 12355 (March 25, 1991); 57 FR 37259 (August 18, 1992); 55 FR at 22596 (June 1, 1990). In fact, the legislative history states explicitly that the treatment standards are not to be technology forcing, but rather are to utilize the available effective treatment technologies. 130 Cong. Rec. S. 1978 (daily ed. July 25, 1984) (statement of Sen. Chaffee); 56 FR at 12355. That is precisely what EPA

has done here.

Second, with specific regard to use of CWA limitations, EPA notes that virtually all of the current LDR treatment standards for wastewaters are already drawn from CWA limitations and standards. See 55 FR at 22601 (wastewater standards for U and P wastes and F039, which essentially became the universal treatment standards, were transferred from treatment data from CWA programs), and see also the Final BDAT Background Document for U and P Wastes and Multi-Source Leachate (F039) Volume C (documenting that most of existing RCRA wastewater standards were transferred from CWA limitations and standards). Moreover, the technologies that are often used to achieve CW $\tilde{\mathbf{A}}$ limitations and standards are, in most cases, the same technologies upon which the RCRA Universal Treatment Standards are based. As EPA has already stated, "because most treatment technologies cannot be so precisely calibrated as to achieve, for example, 3.5 ppm rather than 2.7 ppm, the likely result is that the same amount of treatment will occur." 59 FR at 47989 (Sept. 19, 1994). Since frequently the same technologies are used to treat wastewaters, EPA expects the degree of treatment to be comparable.

EPA also emphasizes that RCRA section 1006(b) requires EPA (among other things) to integrate provisions of RCRA and the CWA when implementing RCRA, and to avoid

duplication to the maximum extent possible with CWA requirements. The Agency feels it is accomplishing this requirement by allowing a constituentspecific, CWA treatment standard to satisfy RCRA 3004(m). The Agency reiterates that a technology-based CWA limitation or standard for a hazardous constituent satisfies RCRA because such a limitation or standard directly reflects the capability of BAT technologies to treat a specific industry's or facility's wastewater, whereas the RCRA UTS for wastewaters were developed by transferring performance data from various industries, and thus EPA need not make that same transfer when industry-specific (or plant-specific) wastewater treatment data is available.

A water-quality based limitation would also satisfy RCRA section 3004(m). A CWA water quality-based limitation must be at least as stringent as the limitations required to implement an existing technology-based standard. (See CWA section 301(b)(1)(c).) Even where there is no existing BAT limitation for a toxic or nonconventional pollutant, a permit writer must determine whether BAT would be more stringent than the applicable water quality-based limitation, and again, must apply the more stringent of the two potential limitations. (40 CFR 125.3(c)(2).)

If a facility has received a Fundamentally Different Factors (FDF) variance, the limitations established by that variance also satisfy RCRA requirements. Limitations established by the FDF variance process are technology-based standards reflecting facility-specific circumstances, and hence can appropriately be viewed as BDAT as well, just as with RCRA treatability variance standards. See 51

FR at 40605 (Nov. 7, 1986).

EPA also believes that there are adequate constraints in the CWA implementing rules to prevent these end-of-pipe standards from being achieved by means of simple dilution. First, many of the effluent limitation guidelines and standards regulate the mass of pollutants discharged, and thus directly regulate not only the concentration of pollutant discharged but the degree of wastewater flow as well. Even where rules are concentration-based, NPDES permit writers can set requirements which preclude excessive water use, and EPA has so instructed permit writers. (See 58 FR 66151, December 17, 1993, encouraging permit writers to estimate reasonable rate of flow per facility and factor that flow limit into the permit.) These permit conditions can take the form of best management practices,

explicit mass limitations, and conditions on internal waste streams. 40 CFR 122.44(k); 122.45 (f), (g) and (h).

Indirect dischargers are also subject to specific CWA dilution rules in both the general pretreatment rules and the Combined Wastestream Formula (as well as through many of the categorical standards). 40 CFR 403.6 (d) and (e). Many of the guidelines and standards also preclude addition of stormwater runoff to process wastewater to preclude achieving treatment requirements by means of dilution. The Agency is accordingly of the view that end-of-pipe equivalence would be achieved by treatment that removes, immobilizes, or destroys hazardous constituents, and therefore we have determined the treatment satisfies the requirements of RCRA section 3004(m).

EPA emphasizes, however, that it is not addressing the issue of whether cross-media transfers of hazardous constituents become so extensive as to invalidate the wastewater treatment function of a land-based unit. This is the subject of the pending Phase IV proposed rule (60 FR at 43654 (August 22, 1995)), and will be addressed as part

of that proceeding.

D. When CWA Limitations and Standards Become the RCRA Standards

Today's rule establishes the following principles:

1. Direct Dischargers

A CWA limitation becomes the RCRA treatment standard as well in the following situations: (a) where there is a categorical BAT or NSPS limitation for the underlying hazardous constituent; (b) where there is a facility-specific limitation for the underlying hazardous constituent pursuant to 40 CFR 125.3 (c)(2) and (d)(3); (c) where there is a Water Quality-based limitation established pursuant to 40 CFR 122.44(d); or (d) where the facility has received a Fundamentally Different Factors variance establishing an alternative limitation pursuant to 40 CFR Part 125 subpart D.

2. Indirect Dischargers

A Clean Water Act pretreatment standard becomes the RCRA treatment standard as well in the following circumstances: (a) where there is a categorical PSES or PSNS for a particular hazardous constituent; and, (b) where POTWs have developed local limits, in addition to categorical standards, to prevent pass through and interference and apply them to indirect

EPA proposed that if pretreatment standards reflected a finding that a

particular hazardous constituent will not pass through to navigable waters because of efficacious treatment by the POTW, that standard would also satisfy RCRA. The reason is that there will be full-scale treatment of the hazardous. constituent before its final release into the environment. Such full-scale treatment satisfies the court's equivalency test. 60 FR at 11711. EPA is adopting this provision in today's rule

for these reasons.

The Agency also proposed that pretreatment standards based on interference with POTW operations would not be considered to satisfy RCRA. Id. EPA is adopting this position in the final rule. The reason is that interference findings reflect the effect the pollutant may have on overall POTW treatment, not necessarily treatment of the particular constituent. Because the relationship of an interference-based standard with treatment of a particular hazardous constituent is tenuous, EPA does not believe that such a standard can be said to be equivalent to RCRA treatment. Several commenters disagreed with this reasoning, but provided no empirical information calling the Agency's conclusion into question. EPA is consequently adopting this provision as proposed.

3. Zero Dischargers Performing CWA-**Equivalent Treatment**

In the May 24, 1993 emergency rule, EPA established the principle that zero discharge facilities performing CWAequivalent treatment on decharacterized wastewaters would be subject to the rules for direct dischargers, and thus would retain the ability to use surface impoundments as part of the treatment process for decharacterized wastes provided equivalent treatment occurs. 58 FR at 29863-29864. The reason is that these facilities can be performing wastewater treatment identical to, or more stringent than, that required of direct dischargers, and thus the same policy of integrating RCRA and the CWA should apply to such facilities. Id.

EPA is consequently also applying today's rules on equivalency to zero dischargers performing CWA-equivalent treatment, including tank-based systems that ultimately land dispose rather than discharge treated effluent. "CWA equivalent treatment" is defined in 268.37(a) to mean "biological treatment for organics, alkaline chlorination or ferrous sulfate precipitation/ sedimentation for metals, reduction of hexavalent chromium, or other treatment technology that can be demonstrated to perform equally or greater than these technologies".

E. Implementation

1. Where Permits Contain Standards for **Hazardous Constituents**

If a direct discharger subject to the rule (i.e. generating a characteristic waste containing underlying hazardous constituents at concentrations exceeding the treatment standard at the point the waste is generated, and is treating those decharacterized wastes in surface impoundments) has an NPDES permit containing a limitation for that hazardous constituent based on BAT NSPS, BPJ, or a water quality standard, then there are no independent RCRA requirements beyond documenting in the facility's records that this is the facility's mode of compliance.

EPA notes further that if the Agency (or authorized State), as part of the CWA decisionmaking process for setting the limitations, affirmatively decided that such hazardous constituents need not be regulated due to low toxicity, low bioavailability or other environmental factors and that fact is reflected in the rulemaking record, permit or permit record, no additional RCRA standards would apply. If the rulemaking or permit and permit record do not contain such a finding, the permitting authority should reexamine the NPDES permit upon reissuance in order to clarify whether such hazardous constituents need not be regulated. During the time between the date this rule becomes effective and the date the permit is reissued, however, the RCRA Universal Treatment Standards for those constituents must be met.

In addition, if EPA (or an authorized State) affirmatively decided either in the rulemaking or in the permitting process that a particular hazardous constituent is controlled through controls on an indicator pollutant, then again, no additional RCRA standards would apply. For this purpose, however, the Agency would only accept as a valid indicator situations where a toxic pollutant parameter is used as an indicator for another toxic pollutant. The Agency does not believe that use of conventional pollutants (such as BOD or COD) as indicators for toxic constituents guarantees the type of equivalent treatment of hazardous constituents, which EPA feels is necessary to implement the equivalence requirement. 976 F. 2d at 23 n. 8.2

²In making this statement, EPA is of course not calling into question the use of conventional pollutants as valid indicators to satisfy Clean Water Act requirements. The language in the text is directed solely at implementing the court's mandate for purposes of RCRA.

2. Where Permits Do Not Contain a Limitation for a Hazardous Constituent

If the CWA permit either does not contain a limitation for the pollutant or does not regulate the pollutant through an indicator, or in cases when this rule becomes effective before the reissuance of a facility's permit, the RCRA universal treatment standards would apply as they do for any other RCRA hazardous wastestream. In this situation, the owner or operator of a facility has several choices. The owner/ operator could do nothing, in which case the hazardous constituent would be subject to the UTS. These standards would be implemented by rule, and thus would not be embodied in a CWA permit. Enforcement consequently would be solely under RCRA. As noted earlier, the point of compliance could, but need not be, at the end-of-pipe point

In the alternative, a facility could seek amendment of its NPDES permit pursuant to § 122.62(a)(3), requesting that the applicable permitting authority modify the permit at reissuance, or sooner, to add limits for the underlying hazardous constituents reflecting BAT for that pollutant at the facility. Assuming proper design and operation of the wastewater treatment technology, a permit writer in such a case could modify the permit to add a limitation for the pollutant based on Best Professional Judgement reflecting actual BAT treatment (40 CFR 125.3(c)) Modification requests would be processed pursuant to the procedures found at § 124.5. The modified permit limitation would be a CWA requirement and enforceable solely under that statute, but would be deemed by the Agency to satisfy RCRA 3004(m), so that meeting UTS per se would not be required.

A final alternative is for the facility to seek a RCRA treatability variance. EPA is amending the grounds for granting such a variance to include situations where a facility is treating decharacterized wastes by treatment identified as BAT or NSPS (New Source Performance Standards), the technology is designed and operated properly, but is not achieving the UTS (see

§ 268.44(a)).

3. Indirect Dischargers

The same alternatives exist for indirect dischargers. If an underlying hazardous constituent is regulated by a categorical PSES, PSNS, or by a local

limit in a control mechanism reflecting PSES or PSNS—level treatment, then that standard satisfies both RCRA and the CWA. In addition, if there is no pretreatment standard (i.e., PSES/PSNS) for an underlying hazardous constituent, because the Agency determined that there was no pass through, then section 3004(m) is satisfied and the RCRA standard for that underlying hazardous constituents does not apply.

If an underlying hazardous constituent is not regulated nationally by a PSES or PSNS, or by a local limit, it becomes subject to the UTS for that constituent. That UTS would be enforced as a RCRA standard. However, in cases where an underlying hazardous constituent is not already subject to categorical PSES, categorical PSNS, or to a local limit in a control mechanism reflecting PSES or PSNS-level treatment. water quality, or pass through, the control mechanism between the indirect discharger and the applicable control authority would have to be modified in order to avoid application of the UTS by rule. EPA is amending § 403.5(c)(1) and \$403.5(c)(2) of the pretreatment rules to specifically authorize control authorities to make such determinations.

The final option is for a facility to obtain a RCRA treatability variance. Thus, the amendment to the treatability variance rules also applies to indirect dischargers properly operating technology identified as the basis for their PSES or their PSNS standard.

4. Zero Dischargers Performing CWA-**Equivalent Treatment**

The implementation options for zero dischargers performing CWA-equivalent treatment are similar. Some of these facilities may have CWA permits authorizing specified levels of discharge. If these permit limitations apply to underlying hazardous constituents present in the RCRAprohibited portion of the discharge, the CWA permit limit satisfies RCRA as well. The facility also could seek to amend the CWA permit to add limitations for the hazardous constituent. Enforcement then would be exclusively pursuant to the CWA

If the zero discharger has no CWA permit, or the permit does not contain limitations for underlying hazardous constituents and is not amended to do so, then the facility would have to meet the RCRA UTS or an alternative standard established by treatability variance either at the point of discharge 4 or at an earlier point of its

choosing (assuming, of course, that a valid demonstration of bona fide treatment can be made at an earlier point).

5. Implementation When CWA Standards and Limitations Will Not Be the Exclusive Standard

If the facility treats to UTS and does not modify its CWA permit or control mechanism to include a CWA standard/ limitation for an underlying hazardous constituent, EPA is finalizing minimal recordkeeping requirements, under RCRA authority. Generators can use their knowledge to identify the underlying hazardous constituents reasonably expected to be present at the point of generation of the ICRT wastes which are not covered by a CWA limitation or standard and hence must be treated to meet UTS (assuming no permit modification). EPA is requiring that this information be kept on-site in files at the facility. The facility will then monitor compliance with the UTS standard for each of these constituents at the point of ultimate discharge or alternative compliance point, on a quarterly basis, and results of this monitoring must be kept in the facility's on-site files. An exceedence of the RCRA UTS standard must be documented in the facility's on site records.

These same requirements apply to facilities without NPDES permits documenting compliance as zero dischargers with CWA-equivalent treatment who are affected by this rule. The absence of a permit necessitates some alternative means of documenting compliance, and the scheme outlined above seems to be the least burdensome scheme which would still provide a reasonable means of enforcing this rule.

6. RCRA Controls Over Point Source Discharges and Domestic Sewage

Both RCRA and the implementing regulations provide that point source discharges and domestic sewage (including mixtures of domestic sewage with other wastes) are not subject to

point would be at the point of ultimate disposal. For those zero dischargers who discharge to a dry river bed (common in the western U.S.) not considered a "water of the U.S." under the CWA, the point of compliance would be at the end-ofpipe. For those zero dischargers who spray irrigate, or otherwise place the wastewaters on the land after treatment in the surface impoundment, the point of compliance would be at the point just prior to the land placement. Furthermore, zero dischargers treating wastewaters in a tank system followed by spray irrigation or another form of land placement are also subject to this rule. For those zero dischargers who use evaporation ponds, the point of compliance is before the wastewater enters the surface impoundment, as this is the ultimate disposal point.

³EPA is interpreting the language in § 122.62(a)(2) to indicate that the D.C. Circuit's opinion in the Third Third case is new information warranting reopening a permit.

⁴The point of compliance for a zero discharger choosing the point of discharge as a compliance

RCRA subtitle C jurisdiction. RCRA section 1004(27) and § 261.4(a) (1) and (2). Some commenters questioned whether by allowing CWA limitations and standards to satisfy the RCRA treatment standard requirement, EPA were somehow imposing RCRA controls where it lacks authority to do so.

This is not the case. EPA is creating here a mechanism for evaluating whether RCRA-equivalent treatment has occurred for purposes of determining whether surface impoundments (i.e. RCRA land disposal units) can permissibly be used as part of that treatment process. 976 F. 2d at 22-24. The effect, for RCRA purposes, of failing to satisfy the limitations or standards is that the facility has engaged in illegal land disposal by virtue of not performing equivalent treatment. Id. Thus, the effect of the rule is on activity upstream of the discharge point, and these activities are within RCRA's jurisdictional purview.

7. Applicability to the Pulp and Paper Industry

The concerns about integration of CWA and RCRA standards are particularly acute with respect to the pulp and paper industry. EPA is at a critical stage in developing comprehensive multi-media rules for this industry (to control both hazardous air emissions and wastewater discharges). These rules were proposed at 58 FR 66078 (Dec. 17, 1993) and are slated for promulgation by mid-1996. The rules should fundamentally affect (for the better) the types of wastewaters managed at pulp and paper facilities and the potential releases of hazardous constituents from such wastes. The Agency believes that it would be putting the cart before the horse, and would fail to properly integrating RCRA with the CWA (and potentially CAA in this case) by proceeding with implementation of the court's decision for this industry in advance of completion of this rulemaking. Cf. Edison Electric Inst. v. EPA, 2 F. 3d 438, 453 (D.C. Cir. 1993) noting when temporary deferrals of action to allow better integration of overlapping statutes is permissible. The Agency will revisit the question of how to implement the court's decision for the pulp and paper industry upon completion of the existing multi-media rulemaking.

IV. Treatment Standards for Class I Nonhazardous Injection Wells and Response to Comments

A. Introduction

Generally, Class I nonhazardous injection well owners/operators

injecting decharacterized ICRT wastes do not substantially treat their waste beyond removing the characteristic by aggregating and diluting wastestreams, plus filtering of solids in order to facilitate injection. There are as many as 100 such nonhazardous facilities in addition to the approximately 54 hazardous facilities injecting ICRT wastes. As discussed in the Phase III proposed rule, EPA estimates that the average flow of a "typical" Class I nonhazardous well is 107,000 gallons/ day. Typically, the volume of hazardous wastes comprises 25% or less of the aggregated injected wastestream

In the Third rule, EPA proposed that characteristic wastes were not prohibited from injection into these deep wells provided they no longer exhibited a characteristic at the point they are injected.e. land disposed. 60 JR at 11704-11705. The D.C. Circuit rejected this portion of the rule, holding, in EPA's reading of the opinion, that the statutory requirements could not be satisfied absent treatment that addressed both short term and long term threats posed by land disposal of the waste, and hence that hazardous constituents in the waste had to be destroyed, removed or immobilized before injection, not merely diluted. 60 JR at 11706-11708. EPA is implementing that mandate in this rule. (However, EPA reiterates, as it did at proposal, that EPA is taking this action to implement the court's mandate, not because it is an environmental priority, or prudent use of the Agency's or the regulated community's resources. The Administration is in fact pursuing a legislative change which would restore EPA's original policy determination reflected in the 1990 Third rule.)

The effect of today's final rule is to prohibit the land disposal of characteristic waste streams at the point they are generated. If those wastes contain underlying hazardous constituents at levels exceeding the Universal Treatment Standards and (as explained further below) at levels and volumes greater than designated de minims amounts, those constituents would have to be destroyed, removed, or immobilized before the waste is injected. This could be accomplished either by segregating the characteristic portion of the injectate for treatment, or by treating the commingled injectate before disposal (i.e. before injection). The rule further provides that if a facility removes an equivalent mass of the hazardous constituent through source reduction, or waste treatment, that the treatment standard is satisfied. The final, alternative means of

compliance is for the unit to have received a no-migration determination.

A number of commenters believed that aggregation or dilution of wastes to remove the hazardous characteristic of the waste stream prior to injection was sufficient and that the requirement to treat underlying constituents was legally unnecessary and onerous. EPA's reading of the Third Third opinion and section 3004(m) is that treatment that destroys, immobilizes, or removes hazardous constituents is required, and that this requirement is not satisfied merely by dilution. The statutory findings of the inherent uncertainty of land disposal of hazardous wastes, the propensity to bioaccumulate these same constituents, the statutory goals of waste minimization and proper waste management, plus the legislative history documenting Congressional intent not to permit treatment by dilution supports the Agency in rejecting these comments. 60 FR at 11706-708. Therefore, the Agency has decided not to allow Class I nonhazardous wells to dilute or aggregate their waste streams in order to fulfill, substitute, or avoid treatment levels or methods established in the LDRs. See the dilution prohibition added in § 148.3 of today's final rule.

Furthermore, the Agency, as proposed, is expanding the applicability of 40 CFR Part 148 to now require owners/operators of Class I nonhazardous wells to determine whether LDRs apply to their facilities.

Commenters likewise sharply questioned the Agency's determinations as to when land disposal prohibitions should attach, and state, correctly in the Agency's view, that the opinion did not compel a determination that prohibitions must attach at the initial point of waste generation or when underlying hazardous constituents are present at that point in concentrations exceeding the UTS. EPA is in fact pursuing alternatives on both of these fronts. The Agency proposed alternatives to the strictest point of generation approach, 60 FR at 11715-716, and expects to take final action on this proposal well before the effective date of the Phase III prohibitions for Class I non-hazardous UIC wells. The source reduction compliance option in this rule is a related means of dealing with this issue, since it can be conceptualized as allowing the requisite hazardous constituent reductions to be achieved by means other than downstream treatment notwithstanding presence of hazardous constituents above UTS at what is technically point of waste generation.

With regard to whether presence of hazardous constituents above UTS

would be the trigger level for the LDR prohibition, EPA has recently proposed risk-based hazardous constituent concentration levels which would implement the "minimize threat" requirement in section 3004(m), and would cap the technology-based treatment standards whenever the technology-based standards are lower (60 FR 66344, December 21, 1995). The de minimis feature of today's rule further addresses situations where EPA believes that prohibitions need not apply due to the low concentrations and volumes of hazardous constituents in the decharacterized portion of the injectate.

B. Compliance Options for Class I Nonhazardous Wells

In the proposed rule, the Agency indicated that facilities could segregate their hazardous wastes, and treat just that volume of the total waste stream to UTS levels in order to conform to the treatment requirement. A number of commenters maintained that the Agency oversimplified this approach and that such segregation was impractical from both a technical and economic standpoint. EPA acknowledges that many facilities may not practically be able to segregate streams. These facilities may utilize of other LDR

compliance options as discussed below. One option would be to apply for an exemption from treatment standards via the no-migration petition variance. EPA is promulgating a clarifying revision to 40 CFR 148.20 which allows facilities to seek a no-migration variance for their Class I nonhazardous wells, and has long indicated that this compliance option is available (see pp. 25-27, Supplemental Information Report prepared for the Notice of Data Availability, January 19, 1993, 58 FR 4972). If these facilities demonstrate to EPA that their formerly characteristic wastes (including any hazardous constituents) will not migrate out of the injection zone for 10,000 years, or no longer pose a threat to human health and the environment because the wastes are attenuated, transformed, or immobilized by natural processes, then they may continue to inject without further treatment.

A significant number of commenters responded to the proposed rule's discussion on the Agency's position on granting no-migration petitions. Comments included that petitions were a too costly option, took too much time to be processed, generic petitions for Class I non-hazardous wells should be granted, and existing no-migration exemptions should not require modification to include Phase III wastes.

These comments, among others, will be discussed in detail in the "Response to Comments" background document for this rule, but basically many had partial merit.

First, although the Agency has estimated earlier that the average petition costs an operator \$343,000, several individual petition reviews have far exceeded that amount. The Agency will examine the possibility of revising petition cost data in future LDR rules. Second, although a petition may take up to 3 years to process, the Agency (as noted above) indicated as early as 1992 (after the Third Third opinion) that it would begin review of Class I nonhazardous injection well nomigration petitions if submitted (58 FR 4972, January 19, 1993). Although time and resource restraints on the Agency are real, the Agency will continue to work with affected Class I operators in order to facilitate the no-migration petition review process. Third, although EPA has established a reasonable knowledge base on the review process for Class I hazardous facilities, it cannot automatically infer that all Class I nonhazardous facilities will successfully make a no-migration demonstration. Well site geology, hydrogeology, abandoned well area of review, and the specific characteristics of the injectate and receiving formation are site specific factors which, as a factual matter, must be evaluated individually in order to demonstrate "to a reasonable degree of certainty" (RCRA section 3004(g)(5)) that the no migration standard has been satisfied. See Supplemental Report to Notice of Data Availability, January 19, 1993, at 25-26 9. It must be remembered that not every Class I injection well applying for the variance has been able to make the demonstration, and that one salutary effect of the no migration process has been to identify certain (albeit a limited number of) wells that would not be capable of adequately containing injectate over the long term.

EPA agrees completely with commenters, however, that wells that already have approved no migration exemptions are not affected by the Third Third opinion and thus are not affected by land disposal restrictions affecting decharacterized wastes. (In fact, EPA does not read the proposal to suggest otherwise.) Absent a change in the waste being injected, there is no reason to reopen no migration determinations that have already evaluated the entire injected waste stream. 57 FR at 31963 (July 20, 1992).

EPA is also promulgating additional means for Class I nonhazardous facilities to comply with the LDR

requirements. Revisions to 40 CFR 148.1(c)(1) and 148.4 will allow Class I nonhazardous owners and operators to apply for a case-by-case extension of the capacity variance for up to one year (renewable for up to an additional year) in order to acquire or construct alternative treatment capacity. Based on experience, EPA believes that the availability of the case-by-case extension coupled with national capacity variance(s) should allow operators more than adequate time to acquire alternative treatment or complete the no-migration petition process. Two other options include the pollution prevention option and the de minimis volume exclusion.

C. Pollution Prevention Compliance Option

The final rule provides an alternative means of obtaining the reductions in mass loadings of hazardous constituents mandated by the Third Third opinion. Under this alternative, mass reductions can be achieved by removing hazardous constituents from any of the wastestreams that are going to be injected, and these reductions in mass loadings can be accomplished by means of source reduction (i.e. equipment or technology modifications, process or procedure modifications, reformulation or redesign of products, substitution of raw materials, and improvements in housekeeping, maintenance, training, or inventory control), recycling, or conventional treatment. As an example, if a facility can make process changes that reduce the mass of cadmium by the same amount that would be removed if the prohibited wastestream was treated to satisfy UTS, the facility would satisfy LDR requirements. The facility could also remove cadmium from any of the streams (prohibited or non-prohibited) which are going to be injected, or could find a means of recycling some portion of the injectate to reduce injected mass loadings of cadmium. In all cases, the result would be that the mass loading of hazardous constituents into the injection unit would be reduced by the same amount as it would be reduced by treatment of the prohibited, characteristic portion of the injectate. 976 F. 2d at 23 n. 8; see also Specialty Steel Inst. v. EPA, 27 F. 3d 642, 649 (D.C. Cir. 1994) (treatment standards that result in lower volume of waste to be disposed—precisely what the alternative standard here can achieve are a permissible means of complying with RCRA section 3004 (m)).

Commenters further requested that this alternative be available on a hazardous constituent by hazardous constituent basis. EPA agrees that this is reasonable since it still results in the requisite reduction of hazardous constituent mass loading and provides desirable compliance flexibility. Of course, if the pollution prevention alternative is used partially, there must still be compliance by some alternative means for the remaining hazardous constituents subject to the prohibition.

The Agency is not, however, adopting any type of hazardous constituent trading provision as part of this rule. It first is not clear that such a provision would satisfy the equivalency test enunciated by the court. In addition, given the narrow time frame available to the Agency to develop this rule, the Agency lacks the time and resources to properly evaluate the ramifications of

the idea in this proceeding.

As a means of implementing this alternative, EPA is adopting the method proposed. The mass/day reduction of a particular underlying hazardous constituents is to be calculated by comparing the injected baseline with the allowance. The injected baseline is determined by multiplying the volume/ day of prohibited hazardous waste generated and subsequently injected times the concentration of hazardous constituents before the pollution prevention measure. The allowance is determined by multiplying the volume/ day of a hazardous constituent generated/injected times the UTS for that constituent. The difference between the injected baseline and the allowance is the required mass/day reduction.

EPA proposed, and is adopting the requirement that after successful employment of a pollution prevention measure, the facility must demonstrate that the injected mass achieves the required mass/day reduction. Because the amount of an underlying hazardous constituent in the injectate is dependent upon the level of production, a correction factor for production is needed. In the example given in the proposal (60 FR 11714), the calculation for the injected baseline was corrected by a production variability factor based on volume. The Agency had solicited comment on whether there are production parameters other than volume (e.g., mass, square footage, etc.). One commenter gave a specific example where square footage would be a more appropriate parameter. Therefore, the Agency is promulgating today that any appropriate parameter may be used to calculate the production variability factor. Another commenter was concerned that in the example the baseline used after pollution prevention seemed to be based on the production rate, whereas the baseline before pollution prevention was not. The

commenter misunderstood the purpose of the production variability factor. In the example the post-pollution prevention injectate was adjusted by the production variability factor; however, the example could have been reorganized such that the initial baseline was adjusted for production variability. It was not necessary to adjust both the pre- and post-pollution prevention baselines for production variabilty; in fact, doing so would cause the variability factor to cancel out.

Several commenters were concerned that there are other factors besides rate of production which could cause variability in the level of an underlying hazardous constituent. One commenter mentioned variations in operation of specific source unit operations such as distillation and/or stripping trains feeding the injection unit. Another commenter stated that since they do not actually produce anything, they have no production rates to use, and suggested basing production on man-hours worked or total water consumed by a facility. The Agency agrees with all these suggestions. The mass/day of an underlying hazardous constituent after pollution prevention is based on the flowrate multiplied by the concentration of the constituent, and must be less than or equal to the calculated mass/day allowance for that underlying hazardous constituent. Beyond this basic formula, the facility can adjust for any factors which would cause a variation in the concentration of the underlying hazardous constituent, provided the variation(s) are part of a normal operating procedure.

Under this approach, a facility would make a one-time change in operating practice. Because the mass loading reductions resulting from the practice are obtained from the time of the change forward, it obviously is not necessary (and neither practical or likely feasible) for the facility to make on-going (potentially daily) changes to qualify

under the provision.

A number of commenters, although supporting the Agency's proposal, argued that it should apply to facilities that already have implemented source reduction or other pollution prevention practices before the effective date of the rule, not just those making the change prospectively (as EPA proposed). Their point is that facilities that have already implemented source reduction, and as a result may now have fewer opportunities to do so, should not be on a worse footing than facilities who have been laxer and thus now have a wider range of possible means of reduction. This argument certainly has equitable force. At the same time, however, there

has to be some objectively defined baseline period for the rule to be enforceable, and for there to be some nexus between the pollution prevention measure and the reduced mass loadings in current injectate. Balancing these considerations, the Agency is establishing 1990 as the base year for establishing a baseline. This was the year EPA adopted (per Congressional schedule) the prohibitions for characteristic hazardous waste and (coincidentally) the year of the Pollution Prevention Act.

EPA is sensitive to other comments regarding the need for this alternative to be objectively verifiable. The Agency is therefore requiring that facilities must monitor the underlying hazardous constituent concentration and the volume of the prohibited hazardous waste stream (i.e. all characteristic streams subject to LDR treatment standard requirements that will be decharacterized before injection), both on the day before and the day after successful implementation of pollution prevention. Results of this monitoring must be reported to the EPA Region or authorized State on a one-time basis. The Agency had solicited comment on whether more than one day is needed for monitoring. Several commenters were concerned that certain pollution prevention methods would take several weeks, not one day, to show results. It should be noted that the Agency did not intend for the pollution prevention method to show results in one day. Results should be achieved by the effective date of the rule for the facility to be in compliance, and the pollution prevention method should have been employed no earlier than 1990. The facility must also include a description of the pollution prevention method used (including any recycling alternative). In addition, the facility will monitor and keep on-site records of the results on a quarterly basis (this time period is selected to match the quarterly monitoring already required under SDWA regulations at 40 CFR 146.13 (b)). If the facility changes its means of complying with this alternative, it must renotify the EPA Region or authorized State, and again document the basis for its compliance by monitoring.

D. De Minimis Volume Exemption

EPA is finalizing the de minimis exemption proposed. 60 FR at 11714-11715. The terms of the exemption are that if decharacterized wastewaters comprise no more than 1% of the total injectate, if the total volume of the characteristic streams do not exceed 10,000 gallons per day, and if underlying hazardous constituents are present in the characteristic wastes at concentrations less than 10 times UTS at the point of generation, then the wastes are not prohibited from injection in a Class I non-hazardous deepwell (assuming the injectate is not hazardous at the point of injection). The Agency continues to believe that under these circumstances, the relatively small decharacterized hazardous waste streams would not appreciably alter the risks posed by the injection practice.

Generally, the proposed approach was well received. Some commenters stated, however, that the de minimis volume exemption, as proposed, would allow excessively large volumes of routinely generated characteristic wastes to go untreated to disposal in deep wells, while others believe that the specific quantifying parameters are overly restrictive. The Agency analyzed potential risks associated with concentrations of 5 contaminants

detected in Class I facility waste streams at 10, 20, and 50 times UTS. (This analysis was conducted in conjunction with revising the Regulatory Impact Analysis For Underground Injected Wastes for this rule. See 60 FR 11715.) In brief, risk estimates for 4 geologic settings and 2 well malfunction scenarios were found to be below levels of regulatory concern at 10 and 20 times UTS. However, at 50 times UTS, risk estimates for cancer and hazard index were above regulatory concern for a waste stream containing carbon tetrachloride, assuming an abandoned borehole failure within 500 feet of the injection well. Taking into account the statutorily enumerated "long-term uncertainties associated with land disposal" (RCRA section 3004(d)(1)(A)), EPA believes the 10 × UTS level to be well within the zone of reasonable values it could select as de minimis. The

one percent volumetric requirement is consistent with other longstanding de minimis exemptions for wastewater management systems in the subtitle C rules (see § 261.3(a)(2)(iv) (A) and (E)), and would normally cap the total volume of characteristic injectate at approximately 1100 gallons per day, given average Class I UIC non-hazardous injection rates.

At a rate of 1100 gallons per day, 10×UTS for carbon tetrachloride would mean a mass loading of approximately 165 mg of the constituents being injected each day. Mass loadings for the other hazardous constituents would similarly be modest. EPA again believes that these small mass loadings would have de minimis effect on the risk potential posed by the injection practice and consequently should be exempted from the prohibition.

V. Treatment Standards for Newly Listed Wastes

A. Carbamates

Hazardous Wastes From Specific Sources (K Waste Codes)

K156—Organic waste (including heavy ends, still bottoms, light ends, spent solvents, filtrates, and decantates) from the production of carbamates and carbamoyl oximes.

K157—Wastewaters (including scrubber waters, condenser waters, washwaters, and separation waters) from the production of carbamates and carbamoyl oximes.

K158—Bag house dust, and filter/ separation solids from the production of carbamates and carbamoyl oximes.

K159—Organics from the treatment of thiocarbamate wastes.

K160—Solids (including filter wastes, separation solids, and spent catalysts) from the production of thiocarbamates and solids from the treatment of thiocarbamate wastes.

K161—Purification solids (including filtration, evaporation, and centrifugation solids), baghouse dust, and floor sweepings from the production of dithiocarbamate acids and their salts. (This listing does not include K125 or K126.)

EPA is promulgating the treatment standards that were proposed for wastes from the carbamate industry specified above.

The preamble of the proposed rule described the basis for these treatment standards in greater detail (60 FR 11720). For background information on waste characterization data, data gathering efforts, and applicable technologies, see the Best Demonstrated Available Technology (BDAT) Background Document for Newly Listed or Identified Wastes from the Production of Carbamates.

The concentration-based treatment standards being promulgated today for carbamate wastewaters and nonwastewaters are at UTS levels for certain constituents, and at newlyestablished levels for other constituents that are today being added to the UTS list. The UTS standards have already been promulgated for 21 of the constituents of concern (16 organic constituents and 5 metals). The Agency is promulgating new UTS for 42 constituents associated with carbamate wastes. Forty of these constituents are chemicals produced by the carbamate industry which may be grouped into the following categories: carbamates and carbamate intermediates, carbamoyl oximes, thiocarbamates, and dithiocarbamates. Please refer to the Background Document for definitions of these chemical groups and the categorization of these 40 chemicals. The other 2 constituents for which new UTS are being promulgated (triethylamine, and o-phenylene diamine) are not carbamate products, but are hazardous constituents present at levels of regulatory concern in carbamate wastes.

One commenter requested clarification on the applicability of the carbamate treatment standards, stating that the summary section of the proposed treatment standards said that treatment standards were being proposed for certain hazardous wastes "including those from the production of carbamate pesticides", whereas the section of the rule that directly addressed carbamate wastes referred to carbamates without the pesticide limitation. EPA points out in response that the final listing rule which defined the new waste codes does not limit the definition to pesticides only. The treatment standards being promulgated apply to all wastes which fit the definitions of the waste codes established in the final listing rule.

One commenter stated that EPA exceeded its authority under RCRA section 3004 and violated the Administrative Procedure Act by preparing the proposed treatment standards and sending this rule to OMB well before the final listing had been promulgated. EPA points out that the proposed treatment standards were actually published after publication of the final listing rule. The proposed treatment standards were modified to conform with the changes that appeared in the final listing; thus, treatment standards were only proposed for those carbamate wastes whose listing had been promulgated in final form. Proposed standards for wastes whose listings were not finalized were eliminated from the proposed treatment standards rule. Given the statutory requirement described above (i.e., the requirement to finalize LDR treatment standards six months after the listing is finalized), Congress must have envisioned that the two rulemaking activities would occur in close proximity.

One commenter had several objections to the proposed standards for thiocarbamate wastes, stating that 1) nonwastewater standards should not have been based on detection limits compiled from sampling and analysis performed as part of the listing process

because the Agency made errors in the sampling and analysis; 2) that EPA has no data to support the assertion that the proposed UTS limits can be met by thermal destruction technologies and that the source of the detection limit used to develop the nonwastewater standard was not clearly identified; and, 3) that no document was found in the record to support the proposed wastewater limit of 0.003 mg/l for thiocarbamate constituents (A2213, Butylate, Cycloate, EPTC, Molinate, Pebulate, Prosulfocarb, Triallate, Vernolate), based on granular activated carbon absorption, giving the commenter no basis to evaluate the achievability of this treatment standard.

To respond, the nonwastewater limit for thiocarbamate wastes was actually based on a detection limit of 0.5 mg/kg by GC/NPD, identified in a general characterization report addressing the newly regulated constituents, rather than on the limit of 0.125 mg/kg by SW-846 8270B, identified in the sampling and analysis reports. The commenter has not yet provided any data to indicate that the proposed treatment standards for nonwastewaters cannot be

met.

The Agency has decided to promulgate a treatment standard of 0.042 mg/l in wastewaters for the thiocarbamate constituents identified above. This standard is based on an analytical detection limit of 0.015 mg/l for Butylate, identified in an activated carbon isotherm test performed by the Office of Water to support development of effluent guideline limitations. The Agency had proposed a wastewater limit of 0.003 mg/l, based on data taken from the PEST (Pesticide Treatability Database) database containing treatability data for pesticides, prepared and maintained by RREL (Risk Reduction Engineering Laboratory) in Cincinnati, Ohio. However, upon review of the available data, the Agency has decided that the Office of Water data is more accurately representative of available wastewater treatment than the pilot-scale data from the PEST database, and has decided to change the final treatment standard accordingly.

EPA is today clarifying that the LDRs do not apply to waste streams which were specifically exempted from the definition of hazardous waste in the final listing rule for carbamates. These waste streams include sludges from the biological treatment of K156 and K157 and streams which satisfy the concentration-based exemption from the definition of K156 and K157 codified at

The promulgation of treatment standards for carbamate wastes has

§ 261.3(a)(2)(iv)(G).

greatly expanded the number of constituents covered by the Universal Treatment Standards at Section 268.48. The Agency wishes to clarify that only a very limited number of generators or treaters, such as manufacturers or users of carbamate products, are expected to have these new constituents present in their wastes. Therefore, affected parties may rely on process knowledge to determine if it is necessary to analyze for these constituents.

The commenter has not yet provided any data to indicate that the proposed treatment standards cannot be met. The commenter did indicate an intention to submit biological treatment data for thiocarbamate wastes. This commenter was instructed to submit this data quickly (by the end of August) to allow the Agency time to give consideration to this data prior to issuing the final rule.

B. Spent Aluminum Potliners (K088)K088—Spent potliners from primary aluminum reduction.

EPA proposed to establish treatment standards for K088 expressed as numerical concentration limits (see 60 FR 11722) for the following constituents: acenapthene, anthracene, benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(g,h,i)perylene, chrysene, dibenz(a,h)-anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, phenanthrene, pyrene, antimony, arsenic, barium, beryllium, cadmium, chromium, lead, mercury, nickel, selenium, silver cyanide and fluoride. Today, EPA is promulgating these treatment standards as proposed. The nonwastewater treatment standards for cyanide, and the organic constituents, are based on a total composition concentration analysis. The nonwastewater treatment standards for fluoride, and the metal constituents, are based on analysis using the TCLP. All wastewater treatment standards are based on total composition concentration analysis.

1. Comments Received on the "Inherently Waste-Like" Determination

The majority of the comments received on the issue of declaring K088 "inherently waste-like" opposed such a determination. As discussed in the proposal, declaring K088 inherently waste-like would require that all K088 treaters/recyclers obtain a RCRA Part B permit regardless of whether the K088 is recycled, reused, used as a feedstock in a process, or conventionally treated. The commenters asserted that this designation would discourage recycling/reuse and development of innovative technologies, and would be overly

burdensome for many of the small companies pursuing recycling technologies.

The Agency was persuaded by commenters that a determination of "inherently waste-like" is unnecessary at this time. Instead, any determination of whether a particular K088 processing technology is a type of excluded recycling activity would need to be made on a case-by-case basis by EPA Regions or authorized states. EPA was persuaded by commenters that allowing individual flexibility in making such a determination is desirable here.

Criteria that are typically relevant in making any such determinations are set out (among other places) at 50 FR at 638 (Jan. 4, 1985); 53 FR at 522 (Jan. 8, 1988); and 56 FR at 7159 and 7185 (Feb. 21, 1991). EPA also repeats the concerns voiced in the proposed rule that spent aluminum potliners contain high concentrations of cyanides and polyaromatic hydrocarbons which may be conventionally treated by thermal recovery processes, and that these and other hazardous constituents are present in the potliners in concentrations well exceeding those found in the raw materials or products for which the spent potliners would be substituting. 60 FR at 11723 n. 11. Other concerns are that the thermal recovery processes appear to pose the same potential risks of harmful air emissions as processing hazardous wastes in industrial furnaces, that the residues of recovery processes may not be adequately treated, and that storage of spent potliners can (and indeed has) posed significant risk. Id. at 11723-24. EPA also repeats that many of these units may already be subject to the rules for industrial furnaces burning hazardous wastes, since those rules apply to industrial furnaces that burn hazardous wastes for energy recovery, material recovery, or destruction. Id. at 11722 and n. 10; 56 FR at 7142; 50 FR at 49171-49174 (Nov. 29, 1985); 40 CFR 266.100.

A consequence of EPA's decision to allow for individualized determinations is that it is also unnecessary (and indeed, not factually justified) to make a general determination of "substantial confusion" pursuant to 270.10(e)(2) which could establish an opportunity for interim status eligibility. That finding would have been premised on the generic inherently wastelike determination (see 60 FR at 11723) which the Agency is not making. EPA is also not pursuing in this proceeding the idea of toxic air emission standards under section 112(d)(1) of the Clean Air Act for these sources. These sources could be subject to these standards if they are major (or, in some cases, area)

sources under section 112, but that determination need not be part of the present rulemaking.

2. Comments Received on Regulated Constituents

EPA requested comment on regulating the phthalates: bis (2-ethylhexyl) phthalate, di-n-butyl phthalate and di-n-octyl phthalate. These constituents have seemingly been detected in the untreated potliner and the treated residue; however, EPA believes that their presence may simply be due to lab contamination. Commenters overwhelmingly requested that these phthalates not be regulated. The Agency agrees and is not including any phthalates in the list of regulated constituents for K088.

A number of commenters requested that benzo(a)pyrene be used as a surrogate for analyzing organics. The commenters were concerned that analytical costs for other PAHs would be excessive. EPA is not convinced that analyzing benzo(a)pyrene would be sufficient for determining proper treatment of all organics. The concentration of one constituent does not always reflect the concentration of similar constituents in a waste. Surrogate analyses assume that all PAHs are present at similar concentrations which may or may not be true. Because of the variability of concentrations found in K088 wastes, benzo(a)pyrene may not be present while other PAHs may be present. Analyzing only for benzo(a)pyrene or any other potential surrogate does not ensure the treatment to UTS concentrations of other PAHs. In addition, the Agency believes that since all of the PAHs are analyzed by a single method the cost increase for additional PAHs should not be significant. Therefore, the Agency does not believe the organic constituents monitored in K088 wastes should be limited to a surrogate indicator. EPA is allowing, however, flexibility in the waste analysis plans developed by the companies with their permit writers to analyze only for those constituents expected to be present in the generated

The Agency proposed to regulate fluoride in K088. While fluoride is not a "hazardous constituent", i.e., listed in Appendix VIII of part 261, it is present in very high concentrations in K088 and is capable of causing substantial harm in the form of groundwater degradation, adverse ecological effects and potential adverse human health effects. The Agency's view thus is that, unless fluoride in this waste is treated, the legal standard in section 3004(m) would not be satisfied. That is, treatment

would not "substantially diminish the toxicity of the waste * * * so that shortterm and long-term threats to human health and the environment are minimized." RCRA section 3004(m)(1). In addition, as discussed in the proposed rule, EPA reads the language in section 3004 (d)(1), (e)(1), and (g)(5) to require that land disposal may still be prohibited after treatment of hazardous constituents if the waste might still pose substantial hazards due to presence of other constituents or properties. 56 FR at 41168 (August 19, 1991); NRDC v. EPA, 907 F. 2d 1146, 1171–72 (D.C. Cir. 1990) (dissenting opinion). These hazards could be posed due to lack of treatment of other constituents in the waste, in this case, fluoride.

The Agency requested comment on whether fluoride should be added to Appendix VIII, as well. The overwhelming response of the commenters is that fluoride should not be added to Appendix VIII. The Agency agrees that fluoride does not pose the same risks in other wastes because it does not occur in such high concentrations. Furthermore, adding fluoride to Appendix VIII has associated potential analytical costs which would be unwarranted. Therefore, even though the Agency is regulating fluoride in K088, it is not adding it to Appendix VIII at this time.

3. Comments Received on Data

Several comments were received regarding EPA's use of data on K088. One comment in particular suggested that EPA ignored relevant data gathered by the Aluminum Association. The Agency did not ignore these data. They were submitted after the proposal and are currently in the docket for this final rule. The Agency has reviewed these data and found that they do not support any changes to the proposed treatment standards that are being finalized in this rule. This issue is discussed in greater detail in the Response to Comments background document.

4. Comments Received on Technical Basis for BDAT

There were a number of comments submitted on the technical basis for the numerical treatment standards. As described in the preamble to the proposed rule, most of the treatment standards are taken from the universal treatment standards (UTS) (59 FR 47988, September 19, 1994) which were developed for each constituent by evaluating all existing Agency data from various technologies. The exception to the UTS for K088 constituents is the fluoride treatment standard, which was taken from the Reynolds delisting

petition. While K088 is a unique waste, available data indicate that these UTS levels can be routinely achieved.

There seemed to be some confusion in that some commenters believed that EPA was proposing a required technology for the treatment of K088. This is not the case. The longstanding position of the Agency is when numerical treatment levels are established under the LDR program, any treatment technology (other than impermissible dilution) can be used to achieve those levels.

Additional K088 comments along with EPA's responses are provided in the Response to Comments Background Document located in the docket for this rule.

VI. Improvements to the Existing Land Disposal Restrictions Program

- A. Completion of Universal Treatment Standards
- 1. Addition of Constituents to Table 268.48

As discussed in the section on carbamate wastes, EPA is today adding 42 new constituents to the table of universal treatment standards (Table 268.48), for which treatment standards are being promulgated today.

2. Wastewater Standard for 1.4-Dioxane

EPA proposed on March 2, 1995 (60 FR 11702), to establish a wastewater treatment standard for 1,4-dioxane. 1,4-Dioxane was the only UTS constituent for which EPA had promulgated a nonwastewater treatment standard but not a wastewater standard. At that time, the Agency proposed a wastewater UTS for 1,4-dioxane of 0.22 mg/l. This proposed standard was based on the maximum daily limit for 1,4-dioxane that had been developed as part of the proposed effluent guidelines for the pharmaceutical industry (60 FR 21592, May 2, 1995). This standard was based on a transfer of distillation performance data from methanol to 1,4-dioxane.

Today, the Agency is promulgating a revised treatment standard for wastewater forms of 1,4-dioxane based on 5 data points. This data was submitted by one of the commenters and represents actual treatment of wastewaters containing 1,4-dioxane. The Agency prefers to use actual treatment data in lieu of a data transfer whenever possible. These data show that wastewaters containing between 2265-7365 mg/l of 1,4-dioxane can be treated by distillation to levels between 3-7 mg/l, representing a 99.9% removal rate for the dioxane. As a result of this data submittal, the Agency is today promulgating a UTS of 12.0 mg/l for 1,4dioxane wastewaters based on the performance of distillation. The standard was calculated following the standard methodology employed by EPA in developing all BDAT treatment standards.

Comments received on the wastewater treatment standard for 1,4-dioxane focused on three major points: (1) The unavailability, at the time of proposal, of data from the effluent guidelines proposed rule for the pharmaceutical industry, from which the proposed standard had been derived; (2) the inappropriateness of transferring distillation data from methanol to 1,4-dioxane (based on the effluent guidelines data); and (3) analytical difficulties inherent in analyzing for 1,4 dioxane in wastewater.

In the proposed rule, EPA referenced effluent guidelines data that would be made available to support the proposed wastewater treatment standard for 1,4dioxane (60 FR 11727, footnote 13). Although the Agency believed that these data would be available for public inspection shortly after signature of the proposed rule, this was not the case. The data were available one day following the close of the comment period on the Phase III proposed rule. As a result, many comments were received that criticized the Agency for not providing appropriate pubic review of data that was used to develop a treatment standard.

In light of the delayed release of the effluent guidelines data, the Agency decided to accept comments on these data and the proposed 1,4-dioxane treatment standard for 30 additional days. In addition, the Agency provided notice of this extension to all commenters of the proposed rule. Several comments were received in response to this memo. Most of the commenters who had raised issue with the proposed standard commented on the EPA memo.

In response to the second concern raised by commenters, the Agency has received actual wastewater treatment data on 1,4-dioxane and as such has developed a UTS based on that data. As stated earlier, the Agency prefers to use actual constituency data from available treatment technology in lieu of transferred data from other constituents whenever feasible.

Finally, several commenters raised concerns regarding the analytical difficulties of reliably detecting and quantifying 1,4-dioxane in wastewater. CMA, in particular, stated that any UTS under 20 mg/l for 1,4-dioxane would be impractical. Other commenters noted extreme variability and difficulty in testing for the presence of 1,4-dioxane

in wastewaters. While the analytical results provided by one of the commenters did show some irregularities, a comprehensive analytical protocol was not provided by the any of the comments which would be needed to fully assess their concerns regarding 1,4-dioxane. As such, the Agency believes that there should be no difficulty in analyzing for 1,4-dioxane in wastewater. Analysis can be accomplished by either direct injection into a GCFID (SW 846, Method 8015B) or a more sensitive analysis involving the injection of an azeotropic distillate preparation into a GCFID (SW-846, Method 5031).

3. Revision to the Acetonitrile Standard

EPA proposed to raise the UTS for the nonwastewater form of acetonitrile from 1.8 mg/kg to 38 mg/kg. Commenters generally supported this revision for the reasons given in the proposed rule. Therefore the Agency is promulgating this revised treatment standard in this rule for the reasons stated at 60 FR 11729.

Related to this, EPA also proposed revoking the special wastewater/ nonwastewater definition for acrylonitrile wastes (K011/13/14), recognizing that these nonwastewaters could consist of over 90% water, and that wastewater treatment is an appropriate means of treating these wastes. Commenters agreed with this, and the Agency is finalizing this today.

B. Aggressive Biological Treatment as BDAT for Petroleum Refinery Wastes

EPA had solicited comment on whether to specify aggressive biological treatment (ABT) as the treatment standard for decharacterized petroleum refining wastewaters. The Agency is not establishing such a treatment standard in this final rule, but is instead promulgating a reduction in the frequency of monitoring required for those facilities using ABT to treat their wastes. The reasons for this are discussed below.

This issue was raised by the American Petroleum Institute (API), which had submitted data to the Agency on ten of its facilities that used aggressive biological treatment. Along with the data, API requested that EPA specify aggressive biological treatment as the treatment standard for their wastes. Such a standard, which would operate in lieu of UTS, would, in API's view, provide adequate treatment and could reduce their monitoring burden. In a similar vein, CMA commented that EPA should specify an optional treatment method (biological treatment) as an alternative to meeting UTS for underlying hazardous constituents reasonably expected to be present in characteristic wastes.

The Environmental Technology Council (ETC) opposed setting ABT as a new technology-specific treatment standard. They argued that biological treatment only partially destroys underlying hazardous constituents. They also felt that reducing the monitoring burden is inadequate justification for creating a new technology-specific standard.

As discussed in the preamble to the proposed rule (60 FR at 11719), biotreatment systems vary in performance both in general and as to specific constituents; the Agency is therefore reluctant to designate ABT as BDAT based on data from only ten facilities. The main reason given by both API and CMA for having a treatment method as the treatment standard was the elimination of the compliance monitoring burden. Although we agree with ETC that reducing monitoring burden is not an adequate justification for creating a new technology-specific treatment standard, EPA is certainly willing to consider more efficient means of ensuring compliance with LDR requirements.
Therefore, EPA is not designating

ABT as BDAT, but is, however, requiring that decharacterized wastes affected by today's rule, which are managed in a wastewater treatment system involving ABT, must be monitored annually to ensure compliance with the treatment standards for underlying hazardous constituents. Other decharacterized wastes affected by today's rule must be monitored quarterly. EPA has been reviewing the paperwork burden posed by the LDR program; this was discussed in the supplemental notice to the LDR Phase IV proposed rule (61 FR 2338, January 25, 1996). As part of this paperwork burden reduction effort, the Agency is considering reducing the monitoring burden for all facilities complying with LDRs. The Agency considers reducing the monitoring burden for facilities treating wastewater with ABT to be a positive step towards this goal, and therefore believes it is justified. Reductions of this type for other types of treatment will be explored in future rulemakings.

C. Dilution Prohibition

Under the existing LDR dilution prohibition (40 CFR 268.3), burning inorganic metal-bearing hazardous wastes can be a form of impermissible dilution. On May 27, 1994, the Assistant Administrator for the Office of Solid Waste and Emergency Response issued

a Statement of Policy which clarified this point (59 FR 27546–27547). Today the Agency is codifying and quantifying

these principles.

As discussed in the proposed rule, impermissible dilution may occur when wastes not amenable to treatment by a certain method (i.e., treated very ineffectively by that treatment method) are nevertheless 'treated' by that method (55 FR 22666, June 1, 1990; 52 FR at 25778–25779, July 8, 1987). Today's rule provides a general distinction between "adequate treatment" and potential violations of the dilution prohibition.

1. Inorganic Metal-Bearing Wastes

The Agency has evaluated the hazardous wastes and has determined that 43 of the RCRA listed wastes (as set forth in 40 CFR part 261) typically appear to be inorganic hazardous wastes that do not contain organics, or contain only insignificant amounts of organics, and are not regulated for organics. BDAT for these inorganic, metal-bearing listed wastes is metal recovery or stabilization. Thus, impermissible dilution may result when these wastes are combusted. When an inorganic metal-bearing hazardous waste with insignificant concentrations of organics is placed in a combustion unit, legitimate treatment for purposes of LDR ordinarily is not occurring. No treatment of the inorganic component occurs during combustion, and therefore, metals are not destroyed, removed, or immobilized. Since there are no significant concentrations of organic compounds in inorganic metal-bearing hazardous wastes, it cannot be maintained that the waste is being properly or effectively treated via combustion (i.e., thermally treated or otherwise destroyed, removed, or immobilized). For this reason, combustion of inorganic wastes is not a "metho[d] of treatment * * * which substantially diminish[es] the toxicity of the waste or substantially reduce[s] the likelihood of migration of hazardous constituents from the waste * * *" (RCRA § 3004(m)) and so is not a permissible method of treatment under that provision.

In terms of the dilution prohibition, if combustion is allowed as a method to achieve a treatment standard for these wastes, metals in these wastes will be dispersed to the ambient air and will be diluted by being mixed in with combustion ash from other waste streams. Adequate treatment (stabilization or metal recovery to meet LDR treatment standards) has not been performed and dilution has occurred. It is also inappropriate to regard eventual

stabilizing of such combustion ash as providing adequate treatment for purposes of the LDRs. Simply meeting the numerical BDAT standards for the ash fails to account for metals in the original waste stream that were emitted to the air and for reductions achieved by dilution with other materials in the ash. (In most cases, of course, the metalbearing wastes will have been mixed with other wastes before combustion, which mixing itself could be viewed as impermissible dilution).

These inorganic, metal-bearing hazardous wastes should be—and are usually—treated by metal recovery or stabilization technologies. These technologies remove hazardous constituents through recovery in products, or through immobilization, and are therefore permissible BDAT

treatment methods.

There are eight characteristic metal wastes; however, only wastes that exhibit the TC as measured by both the TCLP and the EP for D004-D011 are presently prohibited (see 55 FR 22660-22662, June 1, 1990). EPA recently proposed prohibition and treatment standards for wastes identified as hazardous solely because they exhibit the TC (60 FR at 43682, August, 22, 1995). Characteristic wastes, of course, cannot be generically characterized as easily as listed wastes because they can be generated from many different types of processes. For example, although some characteristic metal wastes do not contain organics or cyanide or contain only insignificant amounts, others may have organics or cyanide present which justify combustion, such as a used oil exhibiting the TC characteristic for a metal. Thus, it is difficult to say which D004–D011 wastes would be impermissibly diluted when combusted, beyond stating that as a general matter, impermissible dilution would occur if the D004-D011 waste does not have significant organic or cyanide content but is nevertheless combusted.

An "inorganic metal-bearing waste" is one for which EPA has established treatment standards for metal hazardous constituents, and which does not otherwise contain significant organic or cyanide content. The table being promulgated in 40 CFR part 268, Appendix XI is the list of waste codes for which EPA regulates only metals that are affected by this rule.

2. Inorganic Metal-Bearing Wastes Not Prohibited Under the LDR Dilution Prohibition

Combustion of the following inorganic metal-bearing wastes is not prohibited under the LDR dilution prohibition: (1) wastes that, at the point

of generation, or after any bona fide treatment such as cyanide destruction prior to combustion, contain hazardous organic constituents or cyanide at levels exceeding the constituent-specific treatment standard for UTS; (2) organic, debris-like materials (e.g., wood, paper, plastic, or cloth) contaminated with an inorganic metal-bearing hazardous waste; (3) wastes that, at point of generation, have reasonable heating value such as greater than or equal to 5000 Btu/lb (see 48 FR 11157, March 16, 1983); (4) wastes co-generated with wastes that specify combustion as a required method of treatment; (5) wastes, including soil, subject to Federal and/or State requirements necessitating reduction of organics (including biological agents); and (6) wastes with greater than 1% Total Organic Carbon (TOC).

Several commenters want EPA to add additional criteria. One commenter recommended adding a seventh criterion, i.e., combustion that results in a significant reduction in volume. Several commenters recommended adding a seventh criterion to allow combustion of lab packs. The Agency is not persuaded that a seventh criterion is necessary. It has determined that volume reduction is not a sufficient reason to allow the combustion of inorganic metal-bearing wastes because metals are neither destroyed nor immobilized, and it is possible that a significant amount of metal is being transferred to another media. As for lab packs, in the Phase II final rule (59 FR 47982, September 19, 1994), the Agency specifically addressed lab pack issues when it revised 268 Appendix IV to specify those wastes that are prohibited from inclusion in lab packs destined for combustion. Today's dilution prohibition does not supersede the streamlined treatment standards promulgated in the Phase II final rule. Therefore, metal-bearing inorganic wastes may be included in a lab pack unless it is prohibited under the list of wastes in 268 Appendix IV.

3. Cyanide-Bearing Wastes

A commenter questioned why EPA allows the presence of cyanide to justify combustion when there are adequate alternative treatment methods for that waste constituent. This approach was adopted because cyanide is destroyed—i.e., effectively treated and not diluted—by combustion. Existing LDR rules, in many cases, identify combustion as an appropriate BDAT for destruction of cyanide-bearing wastes. See, e.g., treatment standards for F009, F010, and F011. The LDR Phase III proposal solicited comments on whether the

cyanide criterion should be dropped. Several commenters strongly supported the continued use of combustion as a treatment method for cyanide-bearing wastes, stating that combustion is the most efficient and effective method for treating cyanide wastes. One commenter, ETC, supported dropping the cyanide criterion because of the existence of alternative non-combustion technologies to treat inorganic cyanidebearing wastes without dispersing metals. The Agency disagrees; combustion, when properly conducted, can effectively destroy all the cyanide in a waste. In the Agency's view, this indicates that cyanide wastes which are treated by combustion are not being diluted impermissibly. This issue of whether metals are being dispersed would be addressed through substantive controls on the combustion unit.

4. Table of Inorganic Metal Bearing Wastes

The table being promulgated in 40 CFR part 268, Appendix XI today indicates the list of waste codes for which EPA regulates only metals and/or cyanides that would be affected by this proposed rule. Except for P122, this list is identical to the list originally published in the aforementioned Policy Statement on this subject. The Agency is removing P122 (Zinc Phosphide greater than 10%) from the list of restricted inorganic metal-bearing wastes, because the Agency has previously promulgated a treatment standard of INCIN for the nonwastewater forms of this waste. See 40 CFR 268.40. The policy memo was in error on this point. EPA wishes to clarify that this dilution prohibition is limited to the 51 waste codes in this table. In addition, if an Appendix IX waste meets any of the six criteria discussed above, it would be permissible to combust the waste despite the fact that it is an Appendix IX waste.

D. Expansion of Treatment Options That Will Meet the LDR Treatment Standard "CMBST"

EPA is modifying the treatment standard expressed as INCIN, which specifies hazardous waste incineration, to CMBST, which allows combustion in incinerators, boilers and industrial furnaces. EPA also solicited comment on whether the Catalytic Extraction Process, for which Molten Metal Technology received a determination of equivalent treatment under § 268.42(b), should also be allowed for all wastes which have a treatment standard of CMBST, and whether there are other technologies which are equivalent to

CMBST. Commenters supported the inclusion of the Catalytic Extraction Process (CEP), and since the Agency has determined that (properly operated) it performs in a manner equivalent to other combustion technologies, is adding it to the CMBST standard. Molten Metal Technology commented that the CEP is not in fact a combustion technology, and the Agency has attempted to reflect this in the definition. One commenter, Exide Corporation, requested that their plasma arc process for the recovery of lead also be added to the definition of CMBST. The Exide plasma arc process is in fact an industrial furnace under § 260.10, and is therefore already considered part of the definition of CMBST.

EPA also notes that the new CMBST standard requires that wastes be thermally treated in units that either are subject to subtitle C standards, or, in cases where non-hazardous but prohibited wastes are being thermally treated, in accordance with applicable technical operating requirements. This situation could arise, for example, if a decharacterized waste were then being thermally treated. Such a waste need not be managed in a hazardous waste combustion unit. The regulatory language makes clear that nonhazardous waste combustion units can be utilized. In fact, the predecessor to the CMBST standard—INCIN—allowed nonhazardous incinerators to be an eligible type of unit because the INCIN standard allowed burning in units subject to applicable emissions standards, which standards did not necessarily have to include subtitle C standards (59 FR 48002, Sept. 19, 1994, and 60 FR 242, June 3, 1995). This language was omitted inadvertently from the CMBST standard, and is being restored in today's rule.

E. Clean Up of 40 CFR Part 268

EPA is finalizing changes to the LDR program to achieve the goal of simplified regulations.

1. Section 268:8

Because treatment standards for all scheduled wastes were promulgated in the Third Third rule in 1990, the § 268.8 "soft hammer" requirements are no longer necessary. Therefore, § 268.8 is removed from part 268.

2. Sections 268.10-268.12

The purpose of Subpart B of 268 was to set out a schedule for hazardous wastes by the date when treatment standards were to be established. Deadlines in all three of these sections were met on time, and the wastes are subject to treatment standards.

Therefore, these three sections are no longer necessary, and are removed.

3. Section 268.2(f)

With the promulgation of UTS in the LDR Phase II final rule (59 FR 47982, September 19, 1994), distinctions in the definitions of wastewaters are unnecessary. The Agency is therefore removing paragraphs (1)–(3) from § 268.2(f).

4. Corrections to Proposed Rule Language

A number of commenters pointed out properly that EPA had proposed an amendment to § 268.9 of the rules which would have the effect of subjecting all listed wastes which also exhibit a characteristic of hazardous waste to evaluate whether the waste contains underlying hazardous constituents not covered by the treatment standard for the listed waste, and if so, to treat for them. See 60 FR at 11741. EPA agrees with the commenters that this provision is unnecessary and is not adopting it. (In fact, the Agency did not intend any farreaching change in proposing the revised language.) The provision is unnecessary because EPA already evaluated which hazardous constituents are present in listed wastes at the time of developing the treatment standards (any of the Background Documents supporting the treatment standards indicates the sampling done, and that the sampling encompassed the whole range of hazardous constituents potentially present). There is no need to duplicate this effort. Consequently, the Agency is not amending § 268.9(b).

Other commenters pointed out that the proposed changes to the de minimis exemption in § 268.1(e)(4)(i) (see 60 FR 11740) inadvertently omitted the language which states that de minimis losses are not prohibited. That language has been put back into the final rule

VII. Capacity Determinations

A. Introduction

This section summarizes the results of the capacity analysis for the wastes covered by this rule. For background information on data sources, methodology, and a summary of each analysis, see the Background Document for Capacity Analysis for Land Disposal Restrictions, Phase III—Decharacterized Wastewaters, Carbamate Wastes, and Spent Potliners, found in the docket for today's rule. For EPA's responses to capacity-related comments, see the Response to Capacity-Related Comments Received on the Phase III

Land Disposal Restrictions Rulemaking, also found in the docket for today's rule.

In general, EPA's capacity analysis methodologies focus on the amount of waste to be restricted from land disposal that is currently managed in land-based units and that will require alternative treatment as a result of the LDRs. The quantity of wastes that are not managed in land-based units (e.g., wastewaters managed only in RCRA exempt tanks, with direct discharge to a POTW) is not included in the quantities requiring alternative treatment as a result of the LDRs. Also, wastes that do not require alternative treatment (e.g., those that are currently treated using an appropriate treatment technology) are not included in these quantity estimates.

EPA's decisions on whether to grant a national capacity variance are based on the availability of alternative treatment or recovery technologies. Consequently, the methodology focuses on deriving estimates of the quantities of waste that will require either commercial treatment or the construction of new on-site treatment systems as a result of the LDRsquantities of waste that will be treated adequately either on site in existing systems or off site by facilities owned by the same company as the generator (i.e., captive facilities) are omitted from the required capacity estimates.

B. Capacity Analysis Results Summary

For the decharacterized ICR and TC wastes managed in CWA, CWAequivalent, and Class I injection well systems, EPA estimates that between 85 and 500 million tons per year (estimated at end-of-pipe) will be affected as a result of today's rule. EPA believes that many affected facilities need time to build treatment capacity for these wastes, as wastewater volumes generally make off-site treatment impractical. Thus, EPA has determined that sufficient alternative treatment capacity is not available, and today is granting a two-year national capacity variance for decharacterized wastewaters.

Commenters to the rule generally supported EPA's decision to grant a national capacity variance for decharacterized wastes managed in CWA, CWA-equivalent, and Class I injection well systems. Numerous other comments were received on issues such as those associated with the definition of point of generation for ICR and TC wastewaters and the applicability of today's rule to wastewater management units other than surface impoundments, such as stormwater impoundments, sumps, sewers, and trenches. The Response to Capacity-Related Comments Received on the Phase III

Land Disposal Restrictions Rulemaking background document provides a detailed discussion of the capacityrelated comments on decharacterized wastewaters and EPA's response to them.

To assess the quantity of D003 wastes that could be affected by the rule other than those wastes managed in CWA and CWA-equivalent systems, EPA extracted information from the 1993 Biennial Reporting System (BRS) on the generation and management of D003 wastes. According to the BRS, approximately 2.2 million tons of D003 wastewaters are currently deepwell injected, 650 tons of D003 nonwastewaters are managed through land application, and 17,600 tons of D003 nonwastewaters are managed in "other" disposal units (not specified in the BRS). These wastes may require additional treatment in order to meet the LDRs. In addition, some D003 waste that may be affected by the rule may not be reported in the BRS, because these wastes may not be considered hazardous by the generator once they have been decharacterized. Although EPA believes that in general there is adequate treatment capacity for these wastes, such capacity may not be immediately available. Therefore, EPA is granting a 90-day capacity variance for D003 wastes that are impacted by the rule and are not managed in CWA and CWA-equivalent systems in order to allow facilities time to determine whether their wastes are affected by this rule, and identify and locate alternative treatment capacity if necessary.

EPA estimates that approximately 105,000—130,000 tons of newly listed wastes included in today's rule will require alternative treatment. In particular, approximately 4,500 tons of carbamate wastes (K156-K161, P127, P128, P185, P188-P192, P194, P196-P199, P201-P205, U271, U277-U280, U364-U367, U372, U373, U375-U379, U381-U387, U389-U396, U400-U404, U407, U409-U411) will require alternative treatment. In addition, 100,000—125,000 tons (not including contaminated media) of spent aluminum potliners (K088) will require alternative treatment capacity.

EPA received a number of comments on its capacity analysis for K088 wastes.

Most commenters disagreed with EPA's proposal not to grant a capacity variance for K088 wastes. Specifically, these commenters believe that EPA overestimated the quantity of available capacity and underestimated the quantity of required capacity. In

performing the capacity analysis for the final rule, EPA considered all of the issues raised by the commenters and

reexamined its estimates of both available and required capacity. EPA found that adequate treatment capacity does exist for K088 wastes, although the amount of treatment capacity appears to be just adequate to accommodate demand. However, some of the facilities capable of treating these wastes may require pretreatment such as grinding or crushing prior to accepting the waste. In order to allow facilities generating K088 adequate time to work out logistics such as transportation, pretreatment capacity, and contracting for treatment capacity, EPA has decided to grant a nine-month national capacity variance for these wastes—the time at which EPA estimates existing treatment capacity will be available as a practical matter. A detailed discussion of the final capacity analysis is provided in the Background Document for Capacity Analysis for Land Disposal Restrictions, Phase III— Decharacterized Wastewaters, Carbamate Wastes, and Spent Potliners and EPA's responses to the individual comments on the K088 capacity analysis are provided in the Response to Capacity-Related Comments Received on the Phase III Land Disposal Restrictions Rulemaking, both of which are in the docket for today's rule.

EPA has determined that there is adequate alternative treatment capacity available for the 4,500 tons of carbamate wastes generated each year and is therefore not granting a national capacity variance for these wastes.

The quantities of radioactive wastes mixed with wastes included in today's rule are generated primarily by the U.S. Department of Energy (DOE). EPA estimates that 820 tons of high-level waste and 360 tons of mixed low-level waste that may be affected by this proposal will be generated annually by DOE. In addition, there are currently 7,000 tons of high-level waste, 10 tons of mixed transuranic waste, and 2,700 tons of mixed low-level waste in storage that may be affected by this rule. DOE currently faces treatment capacity shortfalls for high-level wastes and mixed transuranic wastes. Although DOE does have some available treatment capacity for mixed low-level wastes, most of this capacity is limited to treatment of wastewaters with less than one percent total suspended solids and is not readily adaptable for other waste forms. DOE has indicated that it will generally give treatment priority to mixed wastes that are already restricted under previous LDR rules. Therefore, EPA is granting a two-year national capacity variance to radioactive wastes mixed with the hazardous wastes affected by today's rule. Commenters to the proposed rule supported EPA's

decision to grant a national capacity variance for these wastes.

Table 1 lists each RCRA hazardous waste code for which EPA is today

promulgating LDR standards. For each code, this table indicates whether EPA is granting a national capacity variance for land-disposed wastes. Also, EPA is

granting a three-month national capacity variance for all wastes in this rule to handle logistical problems associated with complying with the new standards.

TABLE 1.—VARIANCES FOR NEWLY LISTED AND IDENTIFIED WASTES

| <u> </u> | Waste description ¹ | | Surface-dis- posed wastes | Deepwell-in- jected wastes |
|---|--|-------------------------------------|---|---|
| Reactive wastes managed in CWA or CWA Reactive wastes not managed in CWA or C Newly identified pesticide wastes managed Newly identified TC organic wastewaters m Spent aluminum potliners (K088) | c-equivalent systems, or CWA-equivalent systems in CWA or CWA-equivalent granded in CWA or CWA or CWA-equivalent for CWA or CWA-equivalent for CWA | nt systems, or SDWA (D001 and D002) | 2 Years 2 Years 3 Months 2 Years 9 Months 3 Months | 2 Years. 3 Months. 2 Years. 2 Years. |

1 Includes soil and debris contaminated with each waste.

VIII. State Authority

A. Applicability of Rules in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. Following authorization, EPA retains enforcement authority under sections 3008, 3013, and 7003 of RCRA, although authorized States have primary enforcement responsibility. The standards and requirements for authorization are found in 40 GFR Part 271.

Prior to HSWA, a State with final authorization administered its hazardous waste program in lieu of EPA administering the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities that the State was authorized to permit. When new, more stringent Federal requirements were promulgated or enacted, the State was obliged to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law.

In contrast, under RCRA section 3006(g) (42 U.S.C. 6926(g)), new requirements and prohibitions imposed by HSWA take effect in authorized States at the same time that they take effect in unauthorized States. EPA is directed to carry out these requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so.

Today's rule is being promulgated pursuant to sections 3004(d) through (k), and 3004(m), of RCRA (42 U.S.C.

6924(d) through (k), and 6924(m)). Therefore, the Agency is adding today's rule to Table 1 in 40 CFR 271.1(j), which identifies the Federal program requirements that are promulgated pursuant to HSWA, States may apply for final authorization for the HSWA provisions in Table 1, as discussed in the following section of this preamble. Table 2 in 40 CFR 271.1(j) is also modified to indicate that this rule is a self-implementing provision of HSWA.

B. Abbreviated Authorization Procedures for Specified Portions of Today's Rule

On August 22, 1995, EPA proposed in the Phase IV LDR notice an abbreviated authorization procedure that would also be used for certain parts of the Phase III LDR rule that are minor in nature (EPA also proposed to use this procedure for the Universal Treatment Standards (UTS) in the Phase II rule). This procedure is designed to expedite the authorization process by reducing the scope of a State's submittal, for authorization to a State certification and copies of applicable regulations and statutes. EPA would then conduct a short review of the State's request, primarily consisting of a completeness check (see 60 FR 43686 for a full description of the proposed procedures). The parts of the Phase III rule to which the streamlined authorization procedures would be applicable are: (1) treatment standards for newly listed wastes, (2) improvements to the existing land disposal restrictions program, and (3) revisions and corrections to the treatment standards in §§ 268.40 and 268.48. (Further discussion of this issue also is found in the supplemental

proposal to the LDR Phase IV rule (61 FR 2358, 2365, January 25, 1996)).

Although EPA is firmly committed to streamlining the RCRA State authorization procedures, the Agency has decided not to finalize the proposed Category 1 authorization procedures for parts of the Phase III rule today's notice. EPA believes that public comments from both the August 22 proposal and comments submitted for the recent HWIR-contaminated media proposal should be considered before finalizing new procedures for authorization. This full consideration will enable EPA to make the best decision regarding how the authorization process should work. EPA intends to finalize both the Category 1 and Category 2 procedures at the same time.

C. Effect on State Authorization

Because today's Phase III LDR rule is being promulgated under HSWA authority, those sections of today's rule that expand the coverage of the LDR program (e.g., to newly identified wastes) would be implemented by EPA on the effective date of today's rule in authorized States until their programs are modified to adopt these rules and the modification is approved by EPA.

However, some of today's regulatory amendments are neither more or less stringent than the existing Federal requirements. EPA clarified in a December 19, 1994, memorandum (which is in the docket for today's rule) that EPA would not implement the Universal Treatment Standards (promulgated under HSWA authority in the Phase II LDR rule) separately for those States for which the State has received LDR authorization. EPA views any changes from the existing limits to

²The variance determinations listed apply only to radioactive wastes mixed with decharacterized D001–D003 or newly identified D012–D017 wastes managed in CWA and CWA-equivalent systems; to radioactive wastes mixed with newly identified TC organic wastewaters; and to radioactive wastes mixed with spent aluminum potliners, or carbamate production wastes.

be neither more or less stringent since the technology basis of the standards has not changed. Accordingly, EPA will not implement the amendments to the UTS in today's LDR Phase III rule for those states with LDR authorization.

Because today's rule is promulgated pursuant to HSWA, a State submitting a program modification may apply to receive interim or final authorization under RCRA section 3006(g)(2) or 3006(b), respectively, on the basis of requirements that are substantially equivalent or equivalent to EPA's. The procedures and schedule for State program modifications for final authorization are described in 40 CFR 271.21. It should be noted that all HSWA interim authorizations will expire January 1, 2003. (See § 271.24 and 57 FR 60132, December 18, 1992.)

Section 271.21(e)(2) requires that States with final authorization must modify their programs to reflect Federal program changes and to subsequently submit the modification to EPA for approval. The deadline by which the State would have to modify its program to adopt these regulations is specified in § 271.21(e). This deadline can be extended in certain cases (see § 271.21(e)(3)). Once EPA approves the modification, the State requirements become Subtitle C RCRA requirements.

States with authorized RCRA programs may already have requirements similar to those in today's rule. These State regulations have not . been assessed against the Federal regulations being proposed today to determine whether they meet the tests for authorization. Thus, a State is not authorized to implement these requirements in lieu of EPA until the State program modifications are approved. Of course, states with existing standards could continue to administer and enforce their standards as a matter of State law. In implementing the Federal program, EPA will work with States under agreements to minimize duplication of efforts. In most cases, EPA expects that it will be able to defer to the States in their efforts to implement their programs rather than take separate actions under Federal authority.

States that submit official applications for final authorization less than 12 months after the effective date of these regulations are not required to include standards equivalent to these regulations in their application. However, the State must modify its program by the deadline set forth in § 271.21(e). States that submit official applications for final authorization 12 months after the effective date of these regulations must include standards

equivalent to these regulations in their application. The requirements a State must meet when submitting its final authorization application are set forth in 40 CFR 271.3.

IX. Regulatory Requirements

A. Regulatory Impact Analysis Pursuant to Executive Order 12866

Executive Order No. 12866 requires agencies to determine whether a regulatory action is "significant." The Order defines a "significant" regulatory action as one that "is likely to result in a rule that may: (1) have an annual effect on the economy of \$100 million or more or adversely affect, in a material way, the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities; (2) create serious inconsistency or otherwise interfere with an action taken or planned by another agency; (3) materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients; or (4) raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order."

The Agency estimated the costs of today's rule to determine if it is a significant regulation as defined by the Executive Order. The analysis considers compliance cost and economic impacts for both characteristic wastes and newly listed wastes affected by this rule. For characteristic wastes, the potential cost impacts of this rule depend on whether facilities' current wastewater treatment systems will meet the UTS levels or if additional treatment will be required. If current treatments are adequate, facilities will only incur administrative costs to have their permits revised as well as on-going monitoring costs. In general, the Agency expects that facilities will seek permit modifications, treatability variances, or certification of adequate POTW treatment because these compliance options can be implemented at much lower cost than the option requiring treatment to UTS levels. EPA estimates the total annualized costs of the rule for these wastes would range from approximately \$197,000 to \$598,000, of which \$154,000 to \$425,000 would be incurred at the 28 to 73 potentially affected facilities in the organic chemical industry, and approximately \$43,000 to \$173,000 would be incurred at the 8 to 30 potentially affected facilities in the petroleum refining industry. However, at the high end, if current wastewater

treatment systems need to be augmented with additional treatment steps, the incremental compliance costs for today's rule could be as high as \$1 million per affected facility. The Agency does not have adequate data to estimate how many, if any, facilities may require modification to their treatment facilities. The Agency did conduct a sensitivity analysis, considering the costs of the rule under two scenarios: (1) Assuming that 80 percent of the facilities comply with the rule by obtaining permit modifications and 20 percent comply by treating their wastes, and, (2) assuming that 60 percent comply by obtaining permit modifications and 40 percent comply by treating their wastes. Based on the first scenario, the estimated annualized costs of the rule would range from \$6.6 million to \$18.2 million. Based on the second scenario, the estimated annualized costs would range from \$12.9 million to \$35.7 million. For newly listed wastes, the costs are substantially higher and will be incurred each year. These costs range from approximately \$11.9 million to \$47.3 million and are attributable to thermal treatment of aluminum potliner wastes (K088). Therefore, today's rule may be considered an economically significant rule. Because today's rule is significant, the Agency analyzed the costs, economic impacts, and benefits.

This section of the preamble for today's rule provides a discussion of the methodology used for estimating the costs, economic impacts and the benefits attributable to today's rule, followed by a presentation of the cost, economic impact and benefit results. More detailed discussions of the methodology and results may be found in the background document, "Regulatory Impact Analysis of the Land Disposal Restrictions Final Rule for the LDR Phase III Newly Listed and Identified Wastes," which has been placed in the docket for today's rule.

1. Methodology Section

In today's rule, the Agency is establishing treatment standards for the following wastes: end-of-pipe standards for ignitable, corrosive, and reactive (ICR) wastewaters managed in CWA, CWA-equivalent systems, and UIC wells; Toxicity Characteristic pesticide (D012–17) and organic (D018–43) wastewaters managed in CWA, CWA-equivalent systems, and UIC wells; and newly listed wastes from two industries—spent aluminum potliners and carbamates.

a. Methodology for Estimating the Affected Universe. In determining the costs, economic impacts, and benefits associated with today's rule, the Agency estimated the volumes of waste affected by today's rule. The procedure for estimating the volumes of ICR waste and TC organic and pesticide waste, and newly listed wastes affected by today's rule is summarized below.

First, the Agency examined all industries which might be likely to produce wastes covered under today's standards. Through reviewing comments to the Supplemental Notice of Data Availability published by the Agency in 1993, reviewing runs from the Biennial Reporting System (BRS) of volumes generated from particular industry sectors, as well as discussions with industry, and discussions with the Office of Water at EPA HQ, the Agency narrowed it down to 16 industries which would potentially have significant volumes of wastewater affected by today's rule.

Using a host of databases and/or sources, the Agency collected data on the quantities, constituents, and concentrations of the volumes affected from each of the 16 industries. In addition, the Agency gathered any data on current management practices, plant design, etc. The following sources were used: Toxic Release Inventory (TRI), Section 308 data from the Office of Water, Industrial Studies Database (ISDB), 1991 Biennial Reporting System (BRS), primary summary and development documents data from effluent guidelines, TCRIA documents, data gathered in the capacity analysis performed for today's rule, as well as comments from potentially affected industries.

The Agency obtained volume information for the newly listed wastes—spent aluminum potliners (K088) and carbamate wastes (K156–161)—from the listing documents prepared for these wastes during the listing procedure.

b. Cost Methodology. The cost analysis estimates the national level incremental costs which will be incurred as a result of today's rule. The cost estimates for both the baseline and post-regulatory scenarios are calculated employing: (i) the facility wastestream volume, (ii) the management practice (baseline or post-regulatory) assigned to that wastestream, and (iii) the unit cost associated with that practice. Summing the costs for all facilities produces the total costs for the given waste and scenario. Subtracting the baseline cost from the post-regulatory cost produces the national incremental cost associated with today's rule for the given waste.

The cost methodology section includes three sub-sections: (i) ICR and TC Pesticide and Organic Wastes Managed in CWA and CWA-Equivalent Systems, (ii) Newly Listed Wastes, (iii) Testing and Recordkeeping Costs.

i. ICK and TC Pesticide and Organic Wastes Managed in CWA and CWA-Equivalent Systems. The Agency employed the following approach to estimate the incremental costs for the ICR and TC wastes. First, using information available on the affected industries, the Agency created averagesized model facilities for each industry. Second, for a given model facility in an affected industry, the Agency used available unit cost data to develop costs for the baseline management practices (usually treatment in surface impoundments followed by discharge into receiving waters through a NPDES permit). Third, the Agency used data on the constituents and waste quantities for each industry, where applicable, to determine the necessary treatment required to reduce to UTS levels the constituents present. Fourth, the Agency used unit costs to develop costs for the post-regulatory management practices for the treatment requirements determined in the third step. Fifth, subtracting the baseline from the postregulatory costs for an average facility in an industry sector and using the data available on the number of facilities affected within each industry, the Agency was able calculate the incremental cost for a given industry. Sixth, summing costs across affected industries, the Agency determined the incremental cost for the rule for the endof-pipe treatment standards.

ii. Newly Listed Wastes. The costs for treatment of spent aluminum potliners (K088) and carbamate wastes (K156—161) will be determined using data from the listings on baseline management practices, judgment on the technology(s) required to meet the UTS standards for these wastes, and available unit cost data.

iii. Testing and Recordkeeping Costs. Testing and recordkeeping costs, including costs that facilities will incur for ensuring that hazardous constituents in characteristic waste are meeting new treatment standards and costs associated with permit modifications will be based upon an average, one-time testing cost, on-going monitoring costs, and an Information Collection Request, respectively.

c. Economic Impact Methodology.
The economic effects of today's rule are
defined as the difference between the
industrial activity under post-regulatory
conditions and the industrial activity in
the absence of regulation (i.e., baseline
conditions)

The Agency used (1) historic average capital expenditures for each industry, (2) historic average operating

expenditures for each industry, (3) historic revenues, and (4) historic average pollution abatement and control expenditures (PACE) to determine the economic impacts. However, the Agency was unable to examine the impacts on a facility-specific basis due to lack of data. Therefore, the impacts are assessed on an industry-specific basis.

d. Benefits Methodology. The approach for estimating benefits associated with today's rule involves three components: (i) estimation of pollutant loadings reductions, (ii) estimation of reductions in exceedances of health-based levels, and, (iii) qualitative description of the potential benefits. The benefits assessment is based upon the waste quantity and concentration data collected for the cost analysis. This incremental assessment focuses upon reductions in toxic concentrations at the point of discharge and does not consider any potential benefits resulting from reductions in air emissions or impacts on impoundment leaks and sludges which may occur as part of treating wastes to comply with the LDRs. It is expected that additional treatment to comply with the LDRs may result in risk reductions from air emissions, leaks, and sludges.

EPA has conducted an assessment of the benefits related to the effects of the rule on newly listed spent aluminum potliners. These benefits depend on the incremental risk reductions that may result from treatment of the wastes. In conducting the risk assessment for spent aluminum potliners, EPA improved upon the fate and transport modeling approach used in the RIA. Specifically, in the RIA, EPA applied generic dilution/attenuation factors (DAFs) (which did not reflect constituentspecific fate and transport processes, site-specific hydrogeological conditions, or waste characterization data) to relate the concentration of contaminants in the leachate to their concentration in a down-gradient well. Instead, EPA used its Composite Model for Leachate Migration and Transformation Products (EPACMTP) to perform constituentspecific fate and transport modeling. A summary of the analysis can be found in the Addendum to the RIA placed in the docket for this rule. EPA data indicate that approximately 120,000 metric tons of spent aluminum potliners are generated annually. EPA has not conducted an assessment of the benefits related to the effects of the rule on newly listed carbamate wastes. Because the Agency expects facilities to comply with LDRs through permit modifications, and because the quantity of waste is very small, benefits for

newly listed carbamate wastes are expected to be minimal.

i. Estimation of Pollutant Loadings Reductions. An incremental approach was used to estimate reductions in pollutant loadings. For the baseline scenario, contaminant concentrations were based upon data or estimates of current effluent discharge concentration levels. For the post-regulatory scenario, concentration levels were assumed to equal UTS levels.

ii. Estimation of Reductions in Exceedances of Health-Based Levels. The methods used for evaluating the benefits associated with cancer and noncancer risk reductions resulting from the rule entail comparing constituent concentration levels to health-based standards to evaluate whether implementation of the rule reduces concentration levels below levels that pose risk to human health.

To estimate benefits from cancer risk reductions resulting from the rule, a simple screening analysis was performed. This analysis compared contaminant concentrations for the baseline and post-regulatory scenario to health-based levels for carcinogens. Further analysis may be undertaken to quantify benefits associated with facility/ wastestream combinations identified in the contaminant concentration comparisons.

Benefits associated with reductions in non-cancer exceedances are estimated based upon comparisons of contaminant concentration levels in effluent discharges of the affected wastestreams to the reference health levels. These benefits are expressed in terms of the number of exceedances of health-based levels under the baseline scenario compared to the number of exceedances under the rule.

iii. Qualitative Description of the Potential Benefits. A qualitative assessment of potential benefits likely to result from the rule is used where data are limited. The Agency acknowledges limited data availability in developing waste volumes affected, constituents, concentrations, cost estimates, economic impacts, and benefits estimates for the LDR Phase III rulemaking. The Agency continues to request comment from industry regarding constituents, concentrations, waste volumes, and current management practices.

2. Results

a. Volume Results. The Agency has estimated the volumes of formerly characteristic wastes potentially affected by today's rule to total in the range of 33.5 to 500 million metric tons. The Agency requests comment on waste

volumes affected by the LDR Phase III rule. For newly listed wastes, the analyses supporting the listing determination showed about 4,500 metric tons of carbamate wastes and 118,000 metric tons of spent aluminum potliners are potentially affected by this rule.

 b. Cost Results. For characteristic wastes, the potential cost impacts of this rule depend on whether facilities' current wastewater treatment systems will meet the UTS levels or if additional treatment will be required. If current treatments are adequate, facilities will only incur administrative costs to have their permits revised. EPA estimates the total annualized costs of the rule for these wastes would range from approximately \$197,000 to \$598,000, of which \$154,000 to \$425,000 would be incurred at the 28 to 73 potentially affected facilities in the organic chemical industry, and approximately \$43,000 to \$173,000 would be incurred at the 8 to 30 potentially affected facilities in the petroleum refining industry. However, at the high end, if current wastewater treatment systems need to be augmented with additional treatment steps, the incremental compliance costs could be as high as \$1 million per affected facility. The Agency does not have adequate data to estimate how many, if any, facilities may require modification to their treatment facilities. The Agency continues to request comment and data on how often additional treatment may be required.

For newly listed wastes, the costs are substantially higher and will be incurred each year. These costs range from approximately \$11.9 million to \$47.3 million and are attributable to thermal treatment of aluminum potliner wastes (K088). The Agency requests comment on where industry falls within this range.

 c. Economic Impact Results. The Agency has estimated the economic impacts of today's rule to represent less than one percent of historic pollution control and operating costs for the organic chemical and petroleum refining industries. However, for those facilities that may need to treat to UTS to comply with today's rule, costs could be more significant. The estimated compliance costs for treating newly listed spent aluminum potliners represents 40 percent of pollution control operating costs for aluminum reducers; however, treatment costs represent only one percent of total historic operating costs.

d. Benefit Estimate Results. The Agency expects facilities to comply with the LDRs through permit modifications. As a result, the Agency has estimated the benefits associated with today's rule to be small. Assuming facilities comply with the rule by treating their affected wastestreams, loadings reductions estimates range between 1,527 to 21,322 metric tons per year at 129 to 291 facilities (direct and indirect dischargers) involving 175 to 647 constituent/wastestream combinations. Ninety-eight percent of the reductions occur at organic chemicals facilities, with the remainder occurring at petroleum refiners. Estimated loadings reductions for direct dischargers range between 36 and 267 tons per year, representing between 0.03 and 0.2 percent of total Toxic Release Inventory (TRI) chemical loadings to surface waters. For indirect dischargers, estimated loadings reductions range between 1,491 and 21,055 metric tons per year, representing between 0.8 and 11.0 percent of total TRI chemical loadings transferred to POTWs. Based upon the results of the screening and more detailed risk assessments, the estimated baseline risks associated with nine to twenty wastestreams (out of the 155 to 404 constituent/wastestream combinations potentially affected by the rule) exceed 10⁻⁶ under baseline conditions and three to six wastestreams with noncancer risk levels exceeding reference doses. These 12 to 26 wastestreams contain one of five constituents: aniline (9 to 19 wastestreams), acrylamide (0 to 1 wastestream), pyridine (2 waststreams), barium compounds (1 wastestream), and acetonitrile (0 to 2 wastestreams). For these 12 to 26 wastestreams, EPA conducted a more detailed risk assessment, using site-specific data. Results of the more detailed risk assessment indicate that the benefits from the rule are small. EPA identified four wastestreams potentially posing cancer risk exceeding the threshold risk levels. Three wastestreams pose baseline cancer risk ranging from 1 × 10^{-5} to 1×10^{-4} (due to exposure to aniline) which potentially would be reduced to between 8×10^{-8} and $3 \times$ 10⁻⁶ under the LDR Phase III rule. A fourth wastestream containing acrylamide poses baseline cancer risk at a level of 2×10^{-3} . The rule is estimated to reduce this risk to between 2×10^{-4} and 4×10^{-36} . All four of these wastestreams are discharged to POTWs; if POTW treatment removes these constituents from the wastewater prior to discharge to surface water and/or if no drinking water intake is located downstream from the POTW's outfall, baseline risks will be lower. The Agency expects facilities to comply with the LDRs through permit modifications;

however, additional treatment may result in potentially significant risk reduction.

EPA performed constituent-specific fate and transport modeling using its EPACMTP to further assess cancer and noncancer risks of spent aluminum potliners. Using these additional data, EPA assessment of baseline risks indicates that individual lifetime cancer risks increase to about 10⁻⁶ under central tendency assumptions and 10^{-3} under high-end assumptions. In addition, the new estimates suggest that under high-end assumptions, baseline concentrations in drinking water may be high enough to present noncancer risks; previously, noncancer risks were estimated to be negligible. Consequently, the benefits of regulating spent aluminum potliners are higher than previously estimated. Under central tendency assumptions, individual lifetime cancer risks resulting from current waste management practices are slightly higher than post-regulatory risks (10⁻⁶ versus less than 10^{-6}); some incremental benefits may therefore be realized as a result of the LDRs. Under high-end assumptions, however, the regulation could reduce cancer risks by one or two order of magnitude, while noncancer risks could be eliminated. Although population risks would also be reduced correspondingly, EPA is unable to specify the magnitude of the exposed population.

B. Regulatory Impact Analysis for Underground Injected Wastes

The Agency has completed a separate regulatory impact analysis for underground injected wastes affected by the LDR Phase III final rule. This analysis describes the regulatory impacts only to the Class I injection well universe. The new Phase III LDRs cover decharacterized ICR and TC organic wastes, and other newly-identified hazardous wastes that are distinctly industrial wastes injected by owners and operators of only Class I hazardous and non-hazardous injection wells.

According to the available data outlined in the RIA, our best estimate indicates that of the 223 Class I injection facilities in the nation, up to 154 facilities will be affected by the new Phase III LDRs. Of these facilities, 100 inject nonhazardous waste and 54 inject hazardous waste. Combined, these facilities inject approximately 18 billion gallons of waste annually into Class I wells. These Class I injection wells will now be required to either treat wastes onsite, segregate and ship affected wastes offsite for treatment and

disposal, or file no migration petitions as outlined in the UIC regulations in 40 CFR Part 148 (See 53 FR 28118, July 26, 1988, preamble for a mote thorough discussion of the no migration petition review process). Additional options for compliance with the final Phase III LDRs, including a *de minimis* exemption and a pollution prevention option discussed in detail elsewhere in this rule and in the final UIC RIA.

Of the newly affected Class I facilities, 38 already have no migration exemptions approved by EPA, but they may be required to submit a petition modification to EPA due to the Phase III rule unless their original petition already addressed affected Phase III wastes, including underlying hazardous constituents in decharacterized wastes. In the cases where the petition already covers all hazardous wastes and underlying hazardous constituents in the injected waste stream (i.e., the injectate that was evaluated during the no migration petition process has not changed), no further Agency review of these petitions is necessary. For the facilities which do not have approved no migration exemptions, the rule will add compliance costs to those incurred as a result of previous rulemakings. The Agency analyzed costs and benefits for the final Phase III rule using the same approach and methodology developed in the Regulatory Impact Analysis of the Underground Injection Control Program: Proposed Hazardous Waste Disposal Injection Restriction (53 FR 28118) and subsequent LDR rulemaking. An analysis was performed to assess the economic effect of associated compliance costs for the additional volumes of injected wastes attributable

In general, Class I injection facilities affected by the LDR Phase III rule have several options. As previously outlined, some facilities will modify existing no migration petitions already approved by the Agency, others may submit entirely new petitions, and still others may accept the prohibitions and either continue to inject treated wastes or . cease injection operations altogether. And some facilities with approved petitions already addressing Phase III wastes will have no or little additional compliance costs. EPA assessed compliance costs for Class I facilities submitting no migration petitions, employing alternative treatment, and/or implementing pollution prevention measures. Although facilities using pollution prevention/waste minimization to comply with the Phase III LDRs will likely lower overall regulatory compliance costs, these situations are site-specific and, as the second therefore, EPA cannot estimate these costs savings at this time.

For Class I facilities opting to use alternative treatment, the Agency derived costs for both treating wastes on-site, and/or shipping wastes and treating them off-site at a commercial facility. However, EPA believes that the segregation and transportation of large volumes of liquid wastes off-site is not very practical or cost-effective. This makes the off-site treatment scenario, at best, a highly conservative analysis and in actuality, a least likely and therefore discountable scenario. EPA expects that all injection facilities will opt for the most cost-effective approach in complying with the Phase III final rule and they will either submit a no migration petition or treat their wastes on-site. EPA also assumes that noncommercial facilities will segregate wastes for treatment on-site, whereas commercial facilities will find it more cost effective to not segregate LDR Phase III wastes. For the final rule, EPA estimates that the total annual compliance cost for petitions and alternative on-site treatment to industry affected by the new LDR Phase III prohibitions will range between \$32.91 million to \$34.08 million per year. The average annual compliance costs per affected facility employing on-site alternative treatment were \$217,500. The range of costs for alternative treatment is the result of applying a sensitivity analysis. Only the incremental treatment costs for the new waste listings are calculated in this RIA. All of these costs will be incurred by Class I injection well owners and operators. The average annual compliance costs per affected facility employing on-site alternative treatment were \$217,500. The total annual compliance costs for the 154 potentially affected facilities would therefore be \$33.4 million. These figures were derived by applying the probability of certain outcomes occurring, via the decision tree methodology described in the RIA, to the costs associated with those outcomes for each affected facility

Additionally, as part of the RIA analysis, the costs associated with three differing scenarios also were derived. These scenarios are represented by (1) a minimum case, where all facilities incur only petition costs, (2) a mid-line case, where all facilities incur treatment costs (commercial facilities treat on-site with no waste segregation while non-commercial facilities chose the least cost treatment option), and a maximum case, where all facilities incur both petition and treatment costs. Costs associated with these scenarios range

from \$3.67 million per year for all facilities incurring only petition costs to \$132.62 million per year for all facilities incurring both petition and treatment costs. Based on past EPA experience, there is little probability that all facilities will arrive at each of these possible outcomes. However, this indicated range provides an extreme lower and upper bound estimate for national compliance costs purposes.

The benefits to human health and the environment in the RIA are generally defined as reduced human health risk resulting from fewer instances of ground water contamination. In general, potential health risks from Class I injection wells are extremely low.

EPA conducted a quantitative assessment of the potential human health risks associated with two well malfunction scenarios. EPA developed a methodology described in the RIA to measure health risks of five Phase III contaminants: benzene, carbon tetrachloride, chloroform, phenol, and toluene. The results of these analyses show that most of the cancer risks calculated are below the 1×10^{-4} to 1 \times 10 ⁻⁶ risk range generally used by EPA to regulate exposure to carcinogens. Virtually all of the non-cancer risks are below a hazard index (HI) of 1, which represents a ratio used to compare the relative health risks posed by contaminants. Therefore, these cancer and non-cancer risks calculated are below any levels of regulatory concern. Only two cancer risk estimates in the high end scenarios, those calculated for benzene and carbon tetrachloride, slightly exceeded the risk range to regulate exposure to carcinogens. Only one hazard index calculated for carbon tetrachloride exceeded EPA's level of concern of a ratio greater than 1. However, these results were derived from a scenario where an abandoned borehole (i.e. the "failure pathway") was in very close proximity to the injection well, substantial pumping of a drinking water well was occurring, and the local geology was typical of the highly transmissive East Gulf Coast Region. The assumptions used in deriving these results were based on conservative, upper-bound estimates, therefore the cancer and non-cancer risks represent worst-case estimates. Considering the limitations imposed by the failure scenarios, and the documented low probability of Class I failures, the overall risks from failure of Class I injection wells would be below regulatory concern.

There also is a potential qualitative benefit to the no-migration process for Class I nonhazardous wells. It is possible that the process would uncover certain wells that cannot satisfy the nomigration standard and indeed may not be suitable for Class I injection in any case. This proved to be true for Class I hazardous wells. However, notwithstanding this potential benefit, as noted in the early part of this preamble, the Agency does not regard this regulatory effort as deserving of the priority afforded it, due to the litigationdriven schedule and the D.C. Circuit's mandate, and would not be undertaking the effort at this time were it not for that mandate and schedule.

The economic analysis of LDR Phase III compliance costs suggests that publicly traded companies probably will not be significantly affected. The limited data available for privately-held companies suggests, however, that they may face significant costs due to the proportionally larger expenses they may face due to the LDR Phase III rule.

C. Regulatory Flexibility Analysis

Pursuant to the Regulatory Flexibility Act of 1980, 5 U.S.C. 601 et seq., when an agency publishes a notice of rulemaking, for a rule that will have a significant effect on a substantial number of small entities, the agency must prepare and make available for public comment a regulatory flexibility analysis that considers the effect of the rule on small entities (i.e.: small businesses, small organizations, and small governmental jurisdictions). Under the Agency's Revised Guidelines for Implementing The Regulatory Flexibility Act, dated May 4, 1992, the Agency committed to considering regulatory alternatives in rulemakings when there were any economic impacts estimated on any small entities. (See RCRA sections 3004 (d), (e), and (g)(5), which apply uniformly to all hazardous wastes.) Previous guidance required regulatory alternatives to be examined only when significant economic effects were estimated on a substantial number of small entities.

In assessing the regulatory approach for dealing with small entities in today's rule, for both surface disposal of wastes, the Agency considered two factors. First, data on potentially affected small entities are unavailable. Second, due to the statutory requirements of the RCRA LDR program, no legal avenues exist for the Agency to provide relief from the LDR's for small entities. The only relief available for small entities is the existing small quantity generator provisions and conditionally exempt small quantity generator exemptions found in 40 CFR 262.11-12, and 261.5, respectively. These exemptions basically prescribe 100 kilograms (kg) per calendar month generation of

hazardous waste as the limit below which one is exempted from complying with the RCRA standards.

Given these two factors, the Agency was unable to frame a series of small entity options from which to select the lowest cost approach; rather, the Agency was legally bound to regulate the land disposal of the hazardous wastes covered in today's rule without regard to the size of the entity being regulated.

The Agency has, however, included an exemption covering injection facilities where the decharacterized portion of the injectate is minimal in absolute terms, as a percentage of the total injectate, and in hazardous constituent mass loadings. This deminimis exemption provides a measure of relief to both small and larger entities satisfying its terms.

D. Paperwork Reduction Act

The information collection requirements in this rule have been submitted for approval to the Office of Management and Budget (OMB) under the Paperwork Reduction Act, 44 U.S.C. 3501 et seq. Four Information Collection Request (ICR) documents have been prepared by EPA, as follows. OSWER ICR No. 1442.12 would amend the existing ICR approved under OMB Control No. 2050–0085. The additional information requirements for the Underground Injection Control (UIC) Program were submitted to OMB under ICR No. 0370.14; this will amend the existing UIC approval under OMB Control No. 2040-0042. OSWER ICR No. 1442.12 and UIC ICR No. 0370.14 have not been approved by OMB and the information collection requirements in those ICRs are not enforceable until OMB approves them. EPA will publish a document in the Federal Register when OMB approves the information collection requirements. Until EPA publishes a document displaying the valid OMB control number, persons are not required to respond to collections of information in these two ICRs. Two amendments to National Pollutant Discharge Elimination System (NPDES) ICRs were approved at proposal. These are ICR 0229.10 for the Discharge Monitoring Report, approved under OMB Control No. 2040-0004, and ICR 0226.11 for NPDES Applications, approved under OMB Control No. 2040-

Copies of these ICRs may be obtained from Sandy Farmer, OPPE Regulatory Information Division; U.S. Environmental Protection Agency (2136); 401 M St., S.W.; Washington, D.C. 20460 or by calling (202) 260–2740. Include the ICR numbers in any request. The information requirements for the

OSWER ICR and the UIC ICR are not effective until OMB approves them.

The additional burden associated with the OSWER ICR 1442.12 is as follows. The overall annual burden for the recordkeeping and reporting requirements is 4,202 hours. It is expected that approximately 125 respondents will be affected, therefore, the annual recordkeeping and reporting burden averages 33 hours per respondent. This time is necessary to collect data, submit notifications and certifications to waste treaters and disposers, and to maintain records of this information. The annual cost burden for this rule is approximately \$177,045. Of this amount, it is estimated that facilities will incur annual operation and maintainence capital costs of approximately \$8,375.

The additional burden associated with the UIC Program, explained in ICR 0370.14, is as follows. The estimated annual reporting burden averages 3845 hours per respondent (i.e., inclusive of incremental reporting burdens associated with all affected Class I facilities and Primacy States). The average incremental annual reporting and recordkeeping burdens are about 4,442 hours per each affected Class I nonhazardous facility and about 2,700 hours per each affected Class I hazardous facility. For efforts associated with implementing the rule amendments, the annual incremental State burden equals about 22 hours for each Class I respondent.

Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; develop, acquire, install, and utilize technology and systems for the purposes of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to a collection of information; search data sources; complete and review the collection of information; and transmit or otherwise disclose the information.

An Agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number.

Send comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, including through the use of automated collection of techniques to the Director, OPPE Regulatory Information Division; U.S. Environmental Protection Agency (2136); 401 M St., S.W.; Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th St., N.W., Washington, D.C. 20503, marked "Attention: Desk Officer for EPA." Include the ICR numbers in any correspondence.

X. Unfunded Mandates Reform Act

Under Section 202 of the Unfunded Mandates Reform Act of 1995, signed into law on March 22, 1995, EPA must prepare a statement to accompany any rule where the estimated costs to State, local, or tribal governments in the aggregate, or to the private sector, will be \$100 million or more in any one year. Under Section 205, EPA must select the most cost-effective and least burdensome alternative that achieves the objective of the rule and is consistent with statutory requirements. Section 203 requires EPA to establish a plan for informing and advising any small governments that may be significantly impacted by the rule.

EPA has completed an analysis of the costs and benefits from the LDR Phase III rule and has determined that this rule does not include a Federal mandate that may result in estimated costs of \$100 million or more to either State, local or tribal governments in the aggregate. As. stated above, the private sector may incur costs exceeding \$100 million per year depending upon the option chosen in the final rulemaking. EPA has fulfilled the requirement for analysis under the Unfunded Mandates Reform Act, and results of this analysis have been included in the background document "Regulatory Impact Analysis of the Final Phase III Land Disposal Restrictions Rule," which was placed in the docket for today's rule.

List of Subjects

40 CFR Part 148

Environmental protection, Administrative practice and procedure, Hazardous waste, Reporting and recordkeeping requirements, Water supply.

40 CFR Part 268

Hazardous waste, Reporting and recordkeeping requirements.

40 CFR Part 271

Administrative practice and procedure, Hazardous materials transportation, Hazardous waste, Penalties, Reporting and recordkeeping requirements.

40 CFR Part 403

Reporting and recordkeeping requirements, Waste treatment and disposal, Water pollution control.

Dated: February 16, 1996.

Carol M. Browner,

Administrator.

For the reasons set out in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

PART 148—HAZARDOUS WASTE INJECTION RESTRICTIONS

1. The authority citation for part 148 continues to read as follows:

Authority: Secs. 3004, Resource Conservation and Recovery Act, 42 U.S.C. 6901 *et seq*.

2. Section 148.1 is amended by revising paragraphs (a), (b) and (d) to read as follows:

§ 148.1 Purpose, scope and applicability.

(a) This part identifies wastes that are restricted from disposal into Class I wells and defines those circumstances under which a waste, otherwise prohibited from injection, may be injected.

(b) The requirements of this part apply to owners or operators of Class I hazardous waste injection wells used to inject hazardous waste; and, owners or operators of Class I injection wells used to inject wastes which once exhibited a prohibited characteristic of hazardous waste identified in 40 CFR part 261, subpart C, at the point of generation, and no longer exhibit the characteristic at the point of injection.

(d) Wastes that are only hazardous because they display a characteristic of ignitability, corrosivity, reactivity, or toxicity that are otherwise prohibited, are not prohibited:

(1) If the wastes are disposed into a nonhazardous waste injection well defined under 40 CFR 144.6(a); and

(2) Do not exhibit any prohibited characteristic of hazardous waste identified in 40 CFR part 261, subpart C. and either:

(i) Do not contain any hazardous constituents identified in 40 CFR 268.48 at levels greater than the 40 CFR 268.48 Universal Treatment Standard levels at the point of generation;

(ii) Are de minimis in volume and hazardous constituent concentration levels, as defined in 40 CFR 268.1(e)(4)(ii). (Recordkeeping requirements for this alternative are found at 40 CFR 268.9(d)(4).); or

(iii)(A) The facility removes an equivalent mass of hazardous

constituents as would be removed by treating the characteristic hazardous wastestream pursuant to the treatment standards in 40 CFR 268.48. This mass reduction can come from:

(1) Treating nonhazardous portions of

the injectate:

(2) Recycling before ultimate

injection; or

(3) Engaging in pollution prevention practices (such as equipment or technology modifications, substitution of raw materials, and improvements in housekeeping, maintenance, training, or

inventory control).

- (B) The compliance alternative in paragraph (d)(2)(iii)(A) of this section is demonstrated by comparing the injected baseline (determined by multiplying the volume/day of characteristically hazardous waste generated and injected) times the concentration of hazardous constituents before the treatment/ recycling/pollution prevention measure, with the mass allowance obtained by multiplying the volume/day of a hazardous constituent generated and injected times the universal treatment standard for that constituent. The baseline cannot include practices initiated before the year 1990. (Recordkeeping requirements for this alternative are found at 40 CFR 268.9(d)(3).)
- 3. Section 148.3 is revised to read as

§ 148.3 Dilution prohibited as a substitute for treatment.

(a) The provisions of 40 CFR 268.3 shall apply to owners or operators of Class I wells used to inject a waste which is hazardous at the point of generation whether or not the waste is hazardous at the point of injection.

(b) Owners or operators of Class I nonhazardous waste injection wells which inject waste formerly exhibiting a hazardous characteristic which has been removed by dilution, may address underlying hazardous constituents by treating the hazardous waste, obtaining an exemption pursuant to a petition filed under § 148.20, or complying with the provisions set forth in 40 CFR 268.9.

4. Section 148.4 is revised to read as

§ 148.4 Procedures for case-by-case extensions to an effective date.

The owner or operator of a Class I hazardous or nonhazardous waste injection well may submit an application to the Administrator for an extension of the effective date of any applicable prohibition established under subpart B of this part according to the procedures of 40 CFR 268.5.

5. Section 148.18 is added to subpart

B to read as follows:

§ 148.18 Waste specific prohibitions-Newly Identified Wastes.

(a) On July 8, 1996, the wastes specified in 40 CFR 261.32 as EPA Hazardous waste numbers K156-K161, P127, P128, P185, P188-P192, P194, P196-P199, P201-P205, U271, U277-U280, U364-U367, U372, U373, U375-U379, U381-387, U389-U396, U400-U404, U407, and U409-U411 are prohibited from underground injection.

(b) On January 8, 1997, the wastes specified in 40 CFR 261.32 as EPA Hazardous waste number K088 is prohibited from underground injection.

(c) On April 8, 1998, the wastes specified in 40 CFR part 261 as EPA Hazardous waste numbers D018-043. and Mixed TC/Radioactive wastes, are prohibited from underground injection.

(d) On April 8, 1998, the wastes specified in 40 CFR part 261 as EPA Hazardous waste numbers D001-D003 are prohibited from underground injection.

6. Section 148.20 is amended by revising paragraph (a) introductory text

to read as follows:

§ 148.20 Petitions to allow injection of a waste prohibited under subpart B.

(a) Any person seeking an exemption from a prohibition under subpart B of this part for the injection of a restricted hazardous waste, including a hazardous waste exhibiting a characteristic and containing underlying hazardous constituents at the point of generation, but no longer exhibiting a characteristic when injected into a Class I injection well or wells, shall submit a petition to the Director demonstrating that, to a reasonable degree of certainty, there will be no migration of hazardous constituents from the injection zone for as long as the waste remains hazardous. This demonstration requires a showing that:

PART 268—LAND DISPOSAL RESTRICTIONS

7. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

Subpart A—General

8. Section 268.1 is amended in paragraph (e)(3) by removing the period at the end of the paragraph and adding "; or" in its place, by revising paragraph (e)(4) and by removing paragraph (e)(5) to read as follows:

§ 268.1 Purpose, scope and applicability.

(e) * *

(4) De minimis losses of characteristic wastes to wastewaters are not considered to be prohibited wastes and

are defined as:

(i) Losses from normal material handling operations (e.g. spills from the unloading or transfer of materials from bins or other containers, leaks from pipes, valves or other devices used to transfer materials); minor leaks of process equipment, storage tanks or containers; leaks from well-maintained pump packings and seals; sample purgings; and relief device discharges; discharges from safety showers and rinsing and cleaning of personal safety equipment; rinsate from empty containers or from containers that are rendered empty by that rinsing; and laboratory wastes not exceeding one per cent of the total flow of wastewater into the facility's headworks on an annual basis, or with a combined annualized average concentration not exceeding one part per million in the headworks of the facility's wastewater treatment or pretreatment facility; or

(ii) Decharacterized wastes which are injected into Class I nonhazardous wells which wastes combined volume is less than one per cent of the total flow at the wellhead on an annualized basis, is no greater than 10,000 gallons per day, and in which any underlying hazardous constituents in the characteristic wastes are present at the point of generation at levels less than ten times the treatment

standards found at § 268.48.

9. Section 268.2 is amended by revising paragraphs (f) and (i), and by adding paragraphs (j), (k), and (l) to read as follows:

§ 268.2 Definitions applicable in this part.

- (f) Wastewaters are wastes that contain less than 1% by weight total organic carbon (TOC) and less than 1% by weight total suspended solids (TSS).
- (i) Underlying hazardous constituent means any constituent listed in § 268.48, Table UTS—Universal Treatment Standards, except fluoride, vanadium, and zinc, which can reasonably be expected to be present at the point of generation of the hazardous waste, at a concentration above the constituent-specific UTS treatment standards.
- (j) Inorganic metal-bearing waste is one for which EPA has established treatment standards for metal hazardous constituents, and which does not otherwise contain significant organic or cyanide content as described in § 268.3(b)(1), and is specifically listed in appendix XI of this part.

(k) *End-of-pipe* refers to the point where effluent is discharged to the environment.

(1) Stormwater impoundments are surface impoundments which receive wet weather flow, and only receive process waste during wet weather

events.
10. Section 268.3 is revised to read as follows:

§ 268.3 Dilution prohibited as a substitute for treatment.

(a) No generator, transporter, handler, or owner or operator of a treatment, storage, or disposal facility shall in any way dilute a restricted waste or the residual from treatment of a restricted waste as a substitute for adequate treatment to achieve compliance with subpart D of this part, to circumvent the effective date of a prohibition in subpart C of this part, to otherwise avoid a prohibition in subpart C of this part, or to circumvent a land disposal prohibition imposed by RCRA section and

(b) Dilution of wastes that are hazardous only because they exhibit a hazardous characteristic in a treatment system which treats wastes subsequently discharged to a water of the United States pursuant to a permit issued under section 402 of the Clean Water Act (CWA), or which treats wastes for the purposes of pretreatment requirements under section 307 of the CWA, or zero discharge systems with wastewater treatment equivalent to these systems, is not impermissible dilution, so long as the § 268.48 universal treatment standards are met at the point of discharge, or at a prior point of compliance specified under a CWA permit, for all underlying hazardous constituents reasonably expected to be present at the point of generation of the hazardous waste.

(c) Combustion of the hazardous waste codes listed in Appendix XI of this part is prohibited, unless the waste, at the point of generation, or after any bona fide treatment such as cyanide destruction prior to combustion, can be demonstrated to comply with one or more of the following criteria (unless otherwise specifically prohibited from

combustion):

(1) the waste contains hazardous organic constituents or cyanide at levels exceeding the constituent-specific treatment standard found in § 268.48;

(2) The waste consists of organic, debris-like materials (e.g., wood, paper, plastic, or cloth) contaminated with an inorganic metal-bearing hazardous waste;

(3) The waste, at point of generation, has reasonable heating value such as

greater than or equal to 5000 BTU per pound;

(4) The waste is co-generated with wastes for which combustion is a required method of treatment;

(5) The waste is subject to Federal and/or State requirements necessitating reduction of organics (including biological agents); or

(6) The waste contains greater than 1% Total Organic Carbon (TOC).

11. Section 268.7 is amended by revising the last sentence of paragraph (a) introductory text, paragraphs (a)(1)(ii), (a)(2)(i)(B), (a)(3)(ii), (b)(4)(ii), (b)(5)(iv), by removing "268.45"; at the end of paragraph (a)(1)(iv) and adding "268.45"; and" in its place, by removing "; and," at the end of paragraph (a)(1)(v) and adding a period in its place, by removing paragraph (a)(1)(vi), and by adding paragraph (b)(5)(v) to read as follows:

§ 268.7 Waste analysis and recordkeeping.

(a) * * * If the generator determines that his waste exhibits the characteristic of ignitability (D001) (and is not in the High TOC Ignitable Liquids Subcategory or is not treated by CMBST or RORGS of § 268.42, Table 1), and/or the characteristic of corrosivity (D002), and/or reactivity (D003), and/or the characteristic of organic toxicity (D012–D043), and is prohibited under § 268.37, § 268.38, and § 268.39, the generator must determine the underlying hazardous constituents (as defined in § 268.2, in the D001, D002, D003, or D012–D043 wastes.

(1) * * *

(ii) The waste constituents that the treater will monitor, if monitoring will not include all regulated constituents, for wastes F001–F005, F039, D001, D002, D003, and D012–D043.

Generators must also include whether the waste is a nonwastewater or wastewater (as defined in § 268.2 (d) and (f), and indicate the subcategory of the waste (such as "D003 reactive cyanide"), if applicable;

(2) * * * (i) * * *

(B) The waste constituents that the treater will monitor, if monitoring will not include all regulated constituents, for wastes F001–F005, F039, D001, D002, D003, and D012–D043. Generators must also include whether the waste is a nonwastewater or wastewater (as defined in § 268.2(d) and (f)) and indicate the subcategory of the waste (such as "D003 reactive cyanide"), if applicable;

(3) * * *

(ii) The waste constituents that the treater will monitor, if monitoring will not include all regulated constituents, for wastes F001–F005, F039, D001, D002, D003, and D012–D043.

Generators must also include whether the waste is a nonwastewater or wastewater (as defined in § 268.2(d) and (f)), and indicate the subcategory of the waste (such as "D003 reactive cyanide"), if applicable;

(b) * * *

(4) * * *

(ii) The waste constituents to be monitored, if monitoring will not include all regulated constituents, for wastes F001–F005, F039, D001, D002, D003, and D012–D043. Generators must also include whether the waste is a nonwastewater or wastewater (as defined in § 268.2(d) and (f), and indicate the subcategory of the waste (such as D003 reactive cyanide), if applicable;

(5) * * *

(iv) For characteristic wastes D001, D002, D003, and D012–D043 that are: subject to the treatment standards in § 268.40 (other than those expressed as a required method of treatment); that are reasonably expected to contain underlying hazardous constituents as defined in § 268.2(i); are treated on-site to remove the hazardous characteristic; and are then sent off-site for treatment of underlying hazardous constituents, the certification must state the following:

I certify under penalty of law that the waste has been treated in accordance with the requirements of 40 CFR 268.40 to remove the hazardous characteristic. This decharacterized waste contains underlying hazardous constituents that require further treatment to meet universal treatment standards. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment.

(v) For characteristic wastes D001, D002, D003 and D012–D043 that contain underlying hazardous constituents as defined in § 268.2(i) that are treated on-site to remove the hazardous characteristic and to treat underlying hazardous constituents to levels in § 268.48 Universal Treatment Standards, the certification must state the following:

I certify under penalty of law that the waste has been treated in accordance with the requirements of 40 CFR 268.40 to remove the hazardous characteristic, and that underlying hazardous constituents, as defined in § 268.2, have been treated on-site to meet the § 268.48 Universal Treatment Standards. I am aware that there are

significant penalties for submitting a false certification, including the possibility of fine and imprisonment.

§ 268.8 [Removed and reserved]

12. Section 268.8 is removed and reserved.

13. Section 268.9 is amended by revising paragraphs (a), (d) introductory text, (d)(1)(i), and (d)(1)(ii), and by adding paragraphs (d)(3), (e), (f), and (g) to read as follows:

§ 268.9 Special rules regarding wastes that exhibit a characteristic.

(a) The initial generator of a solid waste must determine each EPA Hazardous Waste Number (waste code) applicable to the waste in order to determine the applicable treatment standards under subpart D of this part. For purposes of this part 268, the waste will carry the waste code for any applicable listing under 40 CFR part 261, subpart D. In addition, the waste will carry one or more of the waste codes under 40 CFR part 261, subpart C, where the waste exhibits a characteristic, except in the case when the treatment standard for the waste code listed in 40 CFR part 261, subpart D operates in lieu of the standard for the waste code under 40 CFR part 261, subpart C, as specified in paragraph (b) of this section. If the generator determines that his waste displays a hazardous characteristic (and the waste is not a D004—D011 waste, a High TOC D001, or is not treated by CMBST, or RORGS of § 268.42, Table 1), the generator must determine what underlying hazardous constituents (as defined in § 268.2), are reasonably expected to be present above the universal treatment standards found in § 268.48.

(d) Wastes that exhibit a characteristic are also subject to § 268.7 requirements, except that once the waste is no longer hazardous, a one-time notification and certification must be placed in the generators or treaters files and sent to the EPA region or authorized state, except for those facilities discussed in paragraph (f) of this section. The notification and certification that is placed in the generators or treaters files must be updated if the process or operation generating the waste changes and/or if the Subtitle D facility receiving the waste changes. However, the generator or treater need only notify the EPA region or an authorized state on an annual basis if such changes occur. Such notification and certification should be sent to the EPA region or authorized state by the end of the

calendar year, but no later than December 31.

(1) * * *

(i) For characteristic wastes other than those managed on site in a wastewater treatment system subject to the Clean Water Act (CWA), zero-dischargers engaged in CWA-equivalent treatment, or Class I nonhazardous injection wells, the name and address of the Subtitle D facility receiving the waste shipment; and

(ii) For all characteristic wastes, a description of the waste as initially generated, including the applicable EPA Hazardous Waste Number(s), treatability group(s), and underlying hazardous constituents.

(3) For characteristic wastes whose ultimate disposal will be into a Class I nonhazardous injection well, and compliance with the treatment standards found in § 268.48 for underlying hazardous constituents is achieved through pollution prevention that meets the criteria set out at 40 CFR 148.1(d), the following information must also be included:

(i) A description of the pollution prevention mechanism and when it was implemented if already complete;

(ii) The mass of each underlying hazardous constituent before pollution prevention;

(iii) The mass of each underlying hazardous constituent that must be removed, adjusted to reflect variations in mass due to normal operating conditions; and

(iv) The mass reduction of each underlying hazardous constituent that is achieved.

(e) For decharacterized wastes managed on-site in a wastewater treatment system subject to the Clean Water Act (CWA) or zero-dischargers engaged in CWA-equivalent treatment, compliance with the treatment standards found at § 268.48 must be monitored quarterly, unless the treatment is aggressive biological treatment, in which case compliance must be monitored annually. Monitoring results must be kept in onsite files for 5 years.

(f) For decharacterized wastes managed on-site in a wastewater treatment system subject to the Clean Water Act (CWA) for which all underlying hazardous constituents (as defined in § 268.2), are addressed by a CWA permit, this compliance must be documented and this documentation must be kept in on-site files.

(g) For characteristic wastes whose ultimate disposal will be into a Class I nonhazardous injection well which qualifies for the *de minimis* exclusion described in § 268.1, information supporting that qualification must be kept in on-site files.

§§ 268.10-268.12 [Removed and Reserved]

14. Sections 268.10 through 268.12 are removed and reserved.

15. Section 268.39 is added to subpart C to read as follows:

§ 268.39 Waste specific prohibitions—Endof-pipe CWA, CWA-equivalent, and Class I nonhazardous injection well treatment standards; spent aluminum potliners; and carbamate wastes.

(a) On July 8, 1996, the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste numbers K156–K161; and in 40 CFR 261.33 as EPA Hazardous Waste numbers P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–U387, U389–U396, U400–U404, U407, and U409–U411 are prohibited from land disposal. In addition, soil and debris contaminated with these wastes are prohibited from land disposal.

(b) On July 8, 1996 the wastes identified in 40 CFR 261.23 as D003 that are managed in systems other than those whose discharge is regulated under the Clean Water Act (CWA), or that inject in Class I deep wells regulated under the Safe Drinking Water Act (SDWA), or that are zero dischargers that engage in CWA-equivalent treatment before ultimate land disposal, are prohibited from land disposal. This prohibition does not apply to unexploded ordnance and other explosive devices which have been the subject of an emergency response (such D003 wastes are prohibited unless they meet the treatment standard of DEACT before land disposal (see § 268.40)).

(c) On July 8, 1996, the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste number K088 are prohibited from land disposal. In addition, soil and debris contaminated with these wastes are prohibited from land disposal.

(d) On April 8, 1998, decharacterized wastes managed in surface impoundments whose discharge is regulated under the Clean Water Act (CWA), or decharacterized wastes managed by zero dischargers in surface impoundments or tanks that engage in CWA-equivalent treatment before ultimate land disposal are prohibited from land disposal. The following are exceptions to this requirement:

(1) Surface impoundments which are permitted under subtitle C of RCRA;

(2) Storm water impoundments as defined in § 268.2;

(3) Surface impoundments which are part of facilities in the pulp, paper, and paperboard industrial category.

(e) On April 8, 1998, Radioactive wastes mixed with K088, K156–K161, P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–U387, U389–U396, U400–U404, and U407, U409–U411 are also prohibited from land disposal. In addition, soil and debris contaminated with these radioactive mixed wastes are prohibited from land disposal.

(f) Between July 8, 1996 and April 8, 1998, the wastes included in paragraphs (a), (b), (c), and (e) of this section may be disposed in a landfill or surface impoundment, only if such unit is in compliance with the requirements

specified in $\S 268.5(h)(2)$.

(g) The requirements of paragraphs (a), (b), (c), (d), and (e) of this section do not apply if:

(1) The wastes meet the applicable treatment standards specified in Subpart

D of this part;

- (2) Persons have been granted an exemption from a prohibition pursuant to a petition under § 268.6, with respect to those wastes and units covered by the petition;
- (3) The wastes meet the applicable alternate treatment standards

established pursuant to a petition granted under § 268.44;

(4) Persons have been granted an extension to the effective date of a prohibition pursuant to § 268.5, with respect to these wastes covered by the extension.

(h) To determine whether a hazardous waste identified in this section exceeds the applicable treatment standards specified in § 268.40, the initial generator must test a sample of the waste extract or the entire waste, depending on whether the treatment standards are expressed as concentrations in the waste extract or the waste, or the generator may use knowledge of the waste. If the waste contains constituents in excess of the applicable Subpart D levels, the waste is prohibited from land disposal, and all requirements of this part 268 are applicable, except as otherwise specified.

16. Section 268.40 is amended by revising paragraph (e) and the table at the end of § 268.40 to read as follows:

§ 268.40 Applicability of treatment standards.

(e) For characteristic wastes (D001–D043) that are subject to treatment standards in the following table "Treatment Standards for Hazardous

Wastes," all underlying hazardous constituents (as defined in § 268.2(i)) must meet Universal Treatment Standards, found in § 268.48, "Table UTS," prior to land disposal.

(1) When these wastes are managed in wastewater treatment systems regulated by the Clean Water Act (CWA), compliance with the treatment standards must be achieved no later than "end-of-pipe" as defined in

§ 268.2(k); or

(2) When these wastes are managed in CWA-equivalent treatment systems and tank-based systems that discharge onto the land, compliance with the treatment standards must be achieved no later than the point the wastewater is released to the land (e.g., spray irrigation, discharge to dry river beds, placed into evaporation ponds); or

(3) When these wastes are managed in Class I nonhazardous injection wells, compliance with the treatment standards must be achieved no later

than the well head; or

(4) For all other, compliance with the treatment standard must be met prior to land disposal as defined in § 268.2(c).

The waste descriptions provided in this table do not replace waste descriptions in 40 CFR part 261. Descriptions of Treatment/Regulatory Subcategories are provided, as needed, to disinquish betweenapplicability of different standards.

OAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with it's salts and/or esters, the CAS number ³ Concentration standards for wastewaters are expressed in mg/l and are based on analysis of composite samples. is given for the parent compound only.

⁴ All treatment standards expressed as a Technology Code or combination of Technology Codes are explained in detail in 40 CFR 268.42 Table 1—Technology Codes and Descriptions of Technology-Based Standards.

Except for Metals (EP or TCLP) and Cyanides (Total and Amenable) the nonwastewater treatment standards expressed as a concentration were established, in part, based upon incineration in units operated in accordance with the technical requirements of 40 CFR Part 264, Subpart O, or Part 265, Subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may comply with these treatment standards according to provisions in 40 CFR 268.40(d). All concentration standards for

«Where an alternate treatment standard or set of alternate standards has been indicated, a facility may comply with this alternate standard, but only for the Treatment/Regulatory Subcategory or physical form (i.e., wastewater and/or nonwastewater) specified for that alternate standard.

⁷ Both Cyanides (Total) and Cyanides (Amenable) for nonwastewaters are to be analyzed using Method 9010 or 9012, found in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", EPA Publication SW–846, as incorporated by reference in 40 CFR 260.11, with a sample size of 10 grams and a distillation time of one hour and 15 minutes.

⁸ As an alternative to these standards, the underlying hazardous constituents in the waste must meet a CWA limitation, which can include a toxic pollutant indicator for the constituent; Pretreatment Standards for Existing Sources; Pretreatment Standards for New Sources; local limitations based upon a pass-through determination; or a Fundamentally Different Factors variance under 40 CFR 125.30–125.32.

17. In § 268.42 Table 1. is amended by revising the entry "CMBST" to read as follows:

§ 268.42 Treatment standards expressed as specified technologies.

TABLE 1.—TECHNOLOGY CODES AND DESCRIPTION OF TECHNOLOGY-BASED STANDARDS

| Technology code | | | Description of tech | nology-based standard | ds | |
|-----------------|------------------|---|---|---|--|--------------------|
| CMBST: | erated in accord | dance with the appliced 266, subpart H. and | cable requirements of in other units ope | * as combustion in incin of 40 CFR part 264, so rated in accordance w as the Catalytic Extrac | ubpart O, or 40 CFR p ith applicable technica | oaπ 265, suppaπ O, |
| * | * | * | * | * | * - | * |

18. Section 268.44 is amended by revising paragraph (a) to read as follows:

§ 268.44 Variance from a treatment standard.

(a) Where the treatment standard is expressed as a concentration in a waste or waste extract and a waste cannot be treated to the specified level, or where the treatment technology is not appropriate to the waste, the generator or treatment facility may petition the Administrator for a variance from the treatment standard. The petitioner must demonstrate that because the physical or chemical properties of the waste differs significantly from wastes analyzed in developing the treatment standard, the waste cannot be treated to specified levels or by the specified methods. The petitioner may also demonstrate that it is treating underlying hazardous constituents in characteristically hazardous wastewaters by sending the waste to a properly designed and operated BAT/PSES system, which may not be achieving the treatment standards found in § 268.48.

19. In § 268.48 the table in paragraph (a) is revised to read as follows:

§ 268.48 Universal treatment standards.

(a) * * *

Notes to table:

¹ CAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with it's salts and/or esters, the CAS number is given for the parent compound only.

² Concentration standards for wastewaters are expressed in mg/l and are based on analysis of composite samples.

³ Except for Metals (EP or TCLP) and Cyanides (Total and Amenable) the nonwastewater treatment standards expressed as a concentration were established, in part, based upon incineration in units operated in accordance with the technical requirements of 40 CFR part 264, subpart O, or 40 CFR part 265, subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may comply with these treatment standards according to provisions in 40 CFR 268.40(d). All concentration standards for nonwastewaters are based on analysis of grab samples.

⁴ Both Cyanides (Total) and Cyanides (Amenable) for nonwastewaters are to be analyzed using Method 9010 or 9012, found in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", EPA Publication SW–846, as incorporated by reference in 40 CFR 260.11, with a sample size of 10 grams and a distillation time of one hour and 15 minutes.

⁵ These constituents are not "underlying hazardous constituents" in characteristic wastes, according to the definition at § 268.2(i).

20. Appendix XI is added to part 268 to read as follows:

APPENDIX XI TO PART 268-METAL BEARING WASTES PROHIBITED FROM DILUTION IN A COMBUSTION UNIT ACCORDING TO 40 CFR 268.3(C) 1

¹ A combustion unit is defined as any thermal technology subject to 40 CFR part 264, subpart O; Part 265, subpart O; and/or 266, subpart H.

PART 271—REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

21. The authority citation for part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a) and 6926.

Subpart A—Requirements for Final Authorization

22. Section 271.1(j) is amended by adding the following entries to Table 1 in chronological order by date of publication in the Federal Register, and by adding the following entries to Table 2 in chronological order by effective date in the Federal Register to read as follows:

§ 271.1 Purpose and scope.

TABLE 1.—REGULATIONS IMPLEMENTING THE HAZARDOUS AND SOLID WASTE AMENDMENTS OF 1984

PART 403—GENERAL PRETREATMENT REGULATIONS FOR EXISTING AND NEW SOURCES OF POLLUTION

23. The authority citation for part 403 continues to read as follows:

Authority: Sec. 54(c)(2) of the Clean Water Act of 1977, (Pub. L. 95–217) sections 204(b)(1)(C), 208(b)(2)(C)(iii), 301(b)(1)(A)(ii), 301(b)(2)(A)(ii), 301(b)(2)(C), 301(h)(5), 301(i)(2), 304(e), 304(g), 307, 308, 309, 402(b), 405 and 501(a) of the Federal Water Pollution Control Act (Pub. L. 92–500) as amended by the Clean Water Act of 1977 and the Water Quality Act of 1987 (Pub. L. 100–4).

24. In § 403.5, paragraphs (c) heading, (c)(1) and (d) are revised to read as follows:

§ 403.5 National pretreatment standards: Prohibited discharges.

(c) Development of specific limits by POTW. (1) Each POTW developing a POTW Pretreatment Program pursuant to § 403.8 shall develop and enforce specific limits to implement the prohibitions listed in paragraphs (a)(1) and (b) of this section. Each POTW with an approved pretreatment program shall continue to develop these limits as necessary and effectively enforce such limits. In addition, the POTW may establish such limits as necessary to address the land disposal restrictions at 40 CFR 268.40.

(d) Local limits. Where specific prohibitions or limits on pollutants or pollutant parameters are developed by a POTW in accordance with paragraph (c) of this section, including those standards established to address land disposal restrictions at 40 CFR 268.40, such limits shall be deemed Pretreatment Standards for the purposes of section 307(d) of the Act.

Land Disposal Restrictions Phase III— Decharacterized Wastewaters, Carbamate Wastes, and Spent Potliners

AGENCY: Environmental Protection Agency (EPA).

ACTION: Partial withdrawal and amendment of final rule.

SUMMARY: Elsewhere in this Federal Register, EPA is promulgating a final rule which, among other things, revises treatment standards for hazardous wastewaters that exhibit the characteristic of ignitability, corrosivity, reactivity, or toxicity. The revised treatment standards were promulgated to implement the mandate of the

opinion of the Circuit Court of Appeals for the District of Columbia Circuit in Chemical Waste Management (CWM) v. EPA, 976 F. 2d 2 (D.C. Cir. 1992) cert. denied 507 U.S. 1057 (1993). On March 26, 1996, President Clinton signed into law the Land Disposal Program Flexibility Act of 1996 which, among other things, provides that the wastes in question are no longer prohibited from land disposal so long as they are not hazardous wastes at the point they are land disposed. By operation of the statute, this provision is made effective immediately and therefore essentially overrules this portion of the CWM opinion. EPA accordingly is incorporating the statutory provision into the regulations by amending and/or withdrawing the portions of the regulations that are superseded by the new legislation. The amendment/ withdrawal of these standards does not affect any other part of the final rule; and the effective dates of the other actions in the final rule likewise will not change. Furthermore, EPA is amending parts of the LDR Phase II final rule, published on September 19, 1994 (59 FR 47982) which are also overruled by the legislation.

EFFECTIVE DATE: April 5, 1996.

FOR FURTHER INFORMATION CONTACT: For general information contact the RCRA Hotline at 800–424–9346 (toll-free) or 703–412–9810 locally. For specific information on the LDR Phase III rule

and this document, contact Peggy Vyas in the Office of Solid Waste, phone 703–308–8594.

SUPPLEMENTARY INFORMATION:

I. Today's Action

Elsewhere in this Federal Register, a final rule is published which revises treatment standards for decharacterized wastewaters that are managed in surface impoundments regulated under the Clean Water Act (CWA) or in CWAequivalent systems, and in Class I nonhazardous waste injection wells regulated under the Safe Drinking Water Act (SDWA). Among other actions, the final rule would have (1) revised 40 CFR 148.1(b) and (d), 148.3, 148.4, 148.20(a), 268.3, 268.40(e), 268.44(a), and 403.5(d); and (2) amended 268.1(e), 268.9(d), and 403.5(c); as well as (3) added 148.18, 268.2 (k) and (l), 268.9 (e), (f), and (g), and 268.39. EPA also promulgated certain regulations as part of the LDR Phase II rule prohibiting injection of certain decharacterized wastes (see 40 CFR 148.17(c) and 268.1(c)(3) at 59 FR 48041 and 48043 (September 19, 1994)).

EPA promulgated these provisions to implement the holding and reasoning of the D.C. Circuit's opinion in CWM v. EPA, 976 F. 2d 2 (D.C. Cir. 1992), cert. denied 507 U.S. 1057 (1993). EPA interpreted this opinion to require hazardous constituents in characteristic wastes to be treated so that the constituents were removed, destroyed or immobilized before the wastes were permanently land disposed, in order to minimize threats posed by land disposal of the wastes. This requirement extended to wastewaters managed in the types of centralized wastewater management systems mentioned above. In doing so, EPA noted in the LDR Phase III final rule, published elsewhere in this Federal Register, that it would not have set treatment standards for hazardous constituents in these characteristic wastewaters at this time but for the court's opinion, and noted the pendency of legislation which could overrule the court's opinion and so require amendments to the final rule.

Congress has now passed that legislation, the Land Disposal Program Flexibility Act of 1996, and President Clinton signed it into law on March 26, 1996 (Public Law 104–119, 100 Stat. 830). A main purpose of the legislation is to put back in place the approach for centrally-managed, decharacterized wastewater which EPA adopted in the LDR "Third Third" rule promulgated on June 1, 1990 (55 FR 22520). The new legislation states, in essence, that hazardous wastes which are hazardous only because they are identified as

exhibiting a characteristic are not prohibited from land disposal if they are managed in either a treatment system whose ultimate discharge is regulated under the CWA (including both direct and indirect dischargers), a CWAequivalent treatment system, or a Class I nonhazardous injection well regulated under the SDWA, provided that the wastes no longer are hazardous (i.e. no longer exhibit a characteristic) at the point land disposal occurs (RCRA § 3004(g) (7) and (8)). The characteristic can be removed by any means, including dilution or other deactivation through aggregation of different wastestreams preceding land disposal (see H. Rep. No. 454, 104th Cong. 2d Sess. at 9). For wastes managed in CWA or CWA-equivalent systems, there is a further caveat that characteristic wastes for which EPA has promulgated a method of treatment as the treatment standard (for example, high TOC ignitable wastes for which the treatment standard is recovery of organics (RORGS) or combustion (CMBST)) remain prohibited unless treated pursuant to that method (RCRA § 3004(g)(7)). Reactive cyanide wastes (i.e. wastes that may release toxic emissions when exposed to pH conditions between 2 and 12 as defined in 40 CFR 261.23(a)(5)) likewise remain prohibited from disposal units in CWA and CWA-equivalent treatment systems unless first treated to satisfy the treatment standard (id.).

The purpose of this notice is to withdraw the portions of the existing rules which are inconsistent with the new statute and therefore no longer in effect, or, in a few limited instances, to amend language which cannot be feasibly withdrawn. Thus, treatment standards for wastes identified as exhibiting a characteristic and managed in centralized wastewater management systems identified above will require only that the wastes be deactivated (i.e. rendered non-hazardous) before they are land disposed. The exception will continue to be for wastes for which the treatment standard is a method of treatment—namely high TOC ignitables-and for reactive cyanide wastes, which must be treated to satisfy the existing treatment standard before land disposal in a surface impoundment at CWA and CWA-equivalent treatment

This action puts back in place the rules which existed before EPA promulgated the LDR Phase III provisions. Thus, for example, withdrawing the version of 148.1(d) promulgated in the LDR Phase III rule has the effect of restoring the previous version of that provision. EPA believes

that withdrawing the portions of the rules that have been superseded is the quickest and simplest way of amending the rules that conform to the new legislation. Certain portions of the LDR Phase III rule have to be amended (namely §§ 268.3, 268.39 and 268.40) because withdrawing them would undo other revisions which are not affected by the legislation. ¹

EPA realizes that there may be certain questions relating to other provisions of the rules which may benefit from clarifying revisions in light of the statutory amendment. (Communications from various affected parties suggesting such changes are part of the record for this notice.) EPA is limiting this notice to changes that have to be made to eliminate superceded regulatory provisions. EPA intends to pursue the possibility of whether clarifying amendments are needed in other proceedings.

EPA does wish, however, that to clarify that as a result of withdrawing these provisions, generators with decharacterized wastewaters that are being managed in CWA or CWA-equivalent systems or injected into Class I nonhazardous injection wells do not have to identify underlying hazardous constituents. EPA also wishes to make clear to States that withdrawing these provisions removes the obligation for States to adopt them as part of an authorized program.

II. Interpretive Issues

A. Definition of CWA-Equivalent Treatment

The legislation does not define what a CWA-equivalent treatment system is, leaving the issue to the Administrator $(RCRA \S 3004(g)(7)(A))$. EPA's existing rules at 40 CFR 268.38(a) provide a definition: "CWA equivalent treatment means biological treatment for organics, alkaline chlorination or ferrous sulfate precipitation for cyanide, precipitation/ sedimentation for metals, reduction of hexavalent chromium, or other treatment technology that can be demonstrated to perform equally or better than these technologies." EPA intends to use this definition in implementing the new statute.

B. Wastes Listed Because They Exhibit a Characteristic

A number of wastes, such as F003 ignitable solvents, are listed as hazardous solely because they exhibit a characteristic of hazardous waste. The legislation does not by its terms apply

¹ In addition, EPA is withdrawing § 148.18(d) because this prohibition already exists in § 148.16 (c) and (f).

to such wastes (it applies only to wastes that are identified by characteristic, and so does not apply to listed wastes). EPA's current rules addressing the status of this type of waste under the LDR program are tangled. The Agency initially found that the dilution prohibition should apply to such wastes. See 56 FR 3864 and 3871 (Jan. 31, 1991). However, in a later notice, EPA amended the rules so that wastewaters that are listed solely because they exhibit a characteristic would not be subject to the dilution prohibition. 57 FR 37194 and 37263 (August 18, 1992). EPA did so to be consistent with the Third Third rule's approach to characteristic wastewaters. Id. at 37210-37211. This action occurred before the D.C. Circuit issued its decision remanding portions of the Third Third rule dealing with wastewaters. The Agency never corrected the regulation (found at 40 CFR 261.3(a)(2)(iii)) to conform to the opinion.

EPA's initial view is that the existing regulatory provision not applying the dilution prohibition to wastewaters listed because they exhibit a characteristic is probably inconsistent with the court's opinion, but that the principles of the new legislation (although not its language) could apply to these wastes. EPA thus has a policy choice as to whether to amend the existing rule. Today's notice is not intended to make policy choices, but rather to withdraw those rules no longer in effect. EPA plans to revisit this issue in a later proceeding. In the interim, the existing rule which provides that the dilution prohibition does not apply to wastewaters listed solely because they exhibit a characteristic remains in effect.

III. Status of Other LDR Treatment Standards

EPA is not withdrawing other treatment standards promulgated in either the LDR Phase III rule or other rules implementing portions of the court's opinion that are unaffected by the new legislation. Consequently, the provisions of the May 24, 1993, Interim Final Rule (58 FR 29860), which applied to disposal not involving the types of centralized wastewater management systems covered by the legislation, remain unaffected. Thus, underlying hazardous constituents in decharacterized wastes that are disposed of in systems other than these centralized wastewater management systems must continue to be treated before land disposal. Similarly, EPA amended the treatment standards for reactive wastes in the LDR Phase III final rule, published elsewhere in this

Federal Register, to require that underlying hazardous constituents be treated when the wastes are land disposed (with an exception for certain types of emergency detonation situations). These requirements are likewise not addressed by the legislation (unless centralized wastewater management of the wastes is involved), and EPA is consequently not withdrawing these treatment standards.

IV. Rationale for Immediate Effective Date

EPA is taking this action without prior notice and opportunity to comment. Because the provisions of the legislation are effective immediately, the legislation overrules the D.C. Circuit's opinion, and thus necessarily overrules the rules implementing those parts of the opinion. Consequently, those rules need to be withdrawn to reflect the new statute. The situation is similar to what the Agency faced in 1985 when it codified portions of the 1984 amendments to RCRA without prior notice and opportunity to comment. 50 FR 28704 (July 15, 1985). The Agency's action was upheld in United Technologies v. EPA, 821 F. 2d 714, 720 (D.C. Cir. 1987). See also Metzenbaum v. Federal Energy Regulatory Commission (FERC), 675 F. 2d 1282, 1291 (D.C. Cir. 1982) (funding orders implementing statutory waiver were non-discretionary acts regulated by such waiver and that notice and comment procedures were unnecessary and possibly contrary to public interest "given the expense that would have been involved in the futile gesture"); Hadson Gas Systems v. FERC, (D.C. Cir. Feb. 9, 1996) F. 2d (because controlling statute left FERC no authority to retain a regulation, notice and comment is not needed to withdraw it). EPA views today's effort as comparable to that involved in codifying the 1984 amendments since the legislation is focused clearly on one particular set of regulations and requires little interpretation by the Agency, and consequently that the decision to issue an immediately final withdrawal is justified. Consequently, EPA believes that good cause exists to issue this rule in immediately final form.

List of Subjects

40 CFR Part 148

Environmental protection, Administrative practice and procedure, Hazardous waste, Reporting and recordkeeping requirements, Water supply.

40 CFR Part 268

Hazardous waste, Reporting and recordkeeping requirements.

40 CFR Part 403

Reporting and recordkeeping requirements, Waste treatment and disposal, Water pollution controls.

Dated: March 29, 1996.

Carol M. Browner,

Administrator.

For the reasons set forth in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

1. The amendments revising 40 CFR 148.1(b) and (d), 148.3, 148.4, 148.20(a) introductory text, 268.3, 268.40(e), 268.44(a), and 403.5(d); as well as the amendments amending 40 CFR 268.1(e), 268.9(d), and 403.5(c); as well as the amendments adding 40 CFR 148.18, 268.2(k) and (l), 268.9(e), (f), and (g), and 268.39 as published elsewhere in this issue of the Federal Register are withdrawn.

PART 148—HAZARDOUS WASTE INJECTION RESTRICTIONS

2. The authority citation for part 148 continues to read as follows:

Authority: Sec. 3004, Resource Conservation and Recovery Act, 42 U.S.C. 6901 *et seq.*

§ 148.17—[Amended]

3. Section 148.17 is amended by removing and reserving paragraph (c).
4. Section 148.18 is added to subpart

B to read as follows:

§ 148.18 Waste specific prohibitions—newly identified wastes.

(a) On July 8, 1996, the wastes specified in 40 CFR 261.32 as EPA Hazardous waste numbers K156–K161, P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–387, U389–U396, U400–U404, U407, and U409–U411 are prohibited from underground injection.

(b) On January 8, 1997, the wastes specified in 40 CFR 261.32 as EPA Hazardous waste number K088 is prohibited from underground injection.

(c) On April 8, 1998, the wastes specified in 40 CFR part 261 as EPA Hazardous waste numbers D018–043, and Mixed TC/Radioactive wastes, are prohibited from underground injection.

PART 268—LAND DISPOSAL RESTRICTIONS

5. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

Subpart A-General

 Section 268.1 is amended by removing and reserving paragraph (c)(3).
 Section 268.3 is revised to read as follows:

§ 268.3 Dilution prohibited as a substitute for treatment.

(a) Except as provided in paragraph (b) of this section, no generator, transporter, handler, or owner or operator of a treatment, storage, or disposal facility shall in any way dilute a restricted waste or the residual from treatment of a restricted waste as a substitute for adequate treatment to achieve compliance with subpart D of this part, to circumvent the effective date of a prohibition in subpart C of this part, to otherwise avoid a prohibition in subpart C of this part, or to circumvent a land disposal prohibition imposed by RCRA section 3004.

(b) Dilution of wastes that are hazardous only because they exhibit a characteristic in a treatment system which treats wastes subsequently discharged to a water of the United States pursuant to a permit issued under section 402 of the Clean Water Act (CWA), or which treats wastes in a CWA-equivalent treatment system, or which treats wastes for the purposes of pretreatment requirements under section 307 of the CWA is not impermissible dilution for purposes of this section unless a method has been specified in § 268.40 as the treatment standard, or unless the waste is a D003 reactive cyanide wastewater or nonwastewater.

(c) Combustion of the hazardous waste codes listed in Appendix XI of this part is prohibited, unless the waste, at the point of generation, or after any bona fide treatment such as cyanide destruction prior to combustion, can be demonstrated to comply with one or more of the following criteria (unless otherwise specifically prohibited from combustion):

(1) The waste contains hazardous organic constituents or cyanide at levels exceeding the constituent-specific

treatment standard found in § 268.48; (2) The waste consists of organic, debris-like materials (e.g., wood, paper, plastic, or cloth) contaminated with an inorganic metal-bearing hazardous waste;

(3) The waste, at point of generation, has reasonable heating value such as greater than or equal to 5000 BTU per pound;

(4) The waste is co-generated with wastes for which combustion is a required method of treatment;

- (5) The waste is subject to Federal and/or State requirements necessitating reduction of organics (including biological agents); or
- (6) The waste contains greater than 1% Total Organic Carbon (TOC).
- 8. Section 268.39 is added to read as follows:

§ 268.39 Waste specific prohibitions spent aluminum potliners; reactive; and carbamate wastes.

- (a) On July 8, 1996, the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste numbers K156–K161; and in 40 CFR 261.33 as EPA Hazardous Waste numbers P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–U387, U389–U396, U400–U404, U407, and U409–U411 are prohibited from land disposal. In addition, soil and debris contaminated with these wastes are prohibited from land disposal.
- (b) On July 8, 1996, the wastes identified in 40 CFR 261.23 as D003 that are managed in systems other than those whose discharge is regulated under the Clean Water Act (CWA), or that inject in Class I deep wells regulated under the Safe Drinking Water Act (SDWA), or that are zero dischargers that engage in CWA-equivalent treatment before ultimate land disposal, are prohibited from land disposal. This prohibition does not apply to unexploded ordnance and other explosive devices which have been the subject of an emergency response. (Such D003 wastes are prohibited unless they meet the treatment standard of DEACT before land disposal (see § 268.40)).
- (c) On January 8, 1997, the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste number K088 are prohibited from land disposal. In addition, soil and debris contaminated with these wastes are prohibited from land disposal.
- (d) On April 8, 1998, Radioactive wastes mixed with K088, K156–K161, P127, P128, P185, P188–P192, P194, P196–P199, P201–P205, U271, U277–U280, U364–U367, U372, U373, U375–U379, U381–U387, U389–U396, U400–U404, and U407, U409–U411 are also prohibited from land disposal. In addition, soil and debris contaminated with these radioactive mixed wastes are prohibited from land disposal.
- (e) Between July 8, 1996, and April 8, 1998, the wastes included in paragraphs (a), (b), (c), and (d) of this section may be disposed in a landfill or surface impoundment, only if such unit is in

- compliance with the requirements specified in § 268.5(h)(2).
- (f) The requirements of paragraphs (a), (b), (c), and (d) of this section do not apply if:
- (1) The wastes meet the applicable treatment standards specified in Subpart D of this part;
- (2) Persons have been granted an exemption from a prohibition pursuant to a petition under § 268.6, with respect to those wastes and units covered by the petition:
- (3) The wastes meet the applicable alternate treatment standards established pursuant to a petition granted under § 268.44;
- (4) Persons have been granted an extension to the effective date of a prohibition pursuant to § 268.5, with respect to these wastes covered by the extension.
- (g) To determine whether a hazardous waste identified in this section exceeds the applicable treatment standards specified in § 268.40, the initial generator must test a sample of the waste extract or the entire waste, depending on whether the treatment standards are expressed as concentrations $\bar{\mathbf{in}}$ the waste extract or the waste, or the generator may use knowledge of the waste. If the waste contains constituents in excess of the applicable Subpart D levels, the waste is prohibited from land disposal, and all requirements of this part 268 are applicable, except as otherwise specified.
- 9. Section 268.40 is amended by revising paragraph (e) to read as follows:

§ 268.40 Applicability of treatment standards.

- (e) For characteristic wastes (D001–D003, and D018–D043) that are subject to treatment standards in the following table "Treatment Standards for Hazardous Wastes," all underlying hazardous constituents (as defined in § 268.2(i)) must meet Universal Treatment Standards, found in § 268.48, "Table UTS," prior to land disposal as defined in § 268.2(c).
- 10. In § 268.40, Table § 268.40, as revised elsewhere in this issue of the **Federal Register**, is further amended by removing note 8 at the end of the table and by revising the entries for D001, D002, D003 and D018–D043 to read as follows:

TREATMENT STANDARDS FOR HAZARDOUS WASTES (Note: NA means not applicable.)

Notes to table:

[FR Doc. 96-8249 Filed 4-5-96; 8:45 am] BILLING CODE 6560-50-P

Notes to table:

¹ The waste descriptions provided in this table do not replace waste descriptions in 40 CFR part 261. Descriptions of Treatment/Regulatory Subcategories are provided, as needed, to distinguish between applicability of different standards.

² CAS means Chemical Abstract Services. When the waste code and/or regulated constituents are described as a combination of a chemical with it's salts and/or esters, the CAS number if given for the parent compound only.

³ Concentration standards for wastewaters are expressed in mg/l and are based on analysis of composite samples.

⁴ All treatment standards expressed as a Technology Code or combination of Technology Codes are explained in detail in 40 CFR 268.42 Table 1—Technology Codes and Descriptions of Technology-Based Standards.

⁵ Except for Metals (EP or TCLP) and Cyanides (Total and Amenable) the nonwastewater treatment standards expressed as a concentration were established, in part, based upon incineration in units operated in accordance with the technical requirements of 40 CFR Part 264, Subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may comply with these treatment standards according to provisions in 40 CFR 268.40(d). All concentration standards for nonwastewaters are based on analysis of grab samples. grab samples.

⁷Both Cyanides (Total) and Cyanides (Amenable) for nonwastewaters are to be analyzed using Method 9010 or 9012, found in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", EPA Publication SW–846, as incorporated by reference in 40 CFR 260.11, with a sample size of 10 grams and distillation time of one hour and 15 minutes.
